

Bar Chart

The chart shows the percentage of households having different goods in a country in Europe in 2004 and 2008.

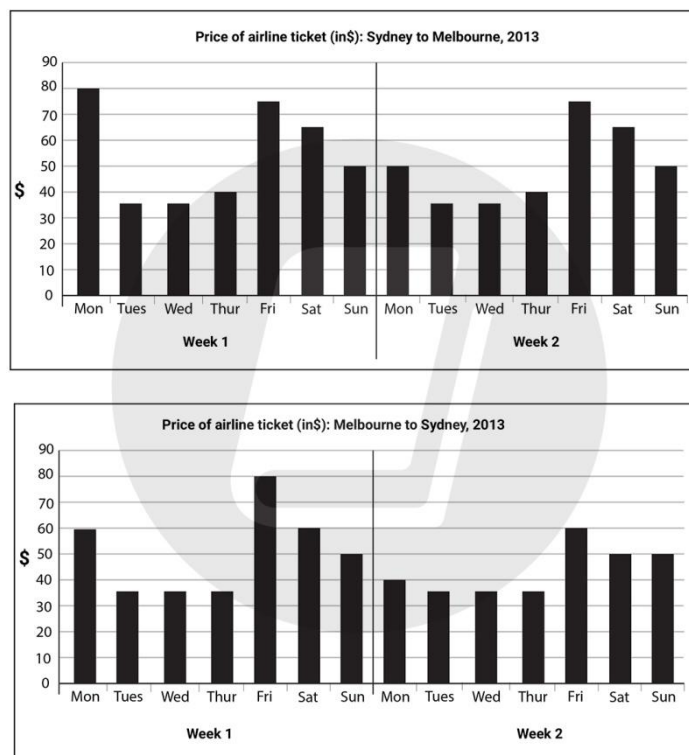

The bar chart compares the percentage of households owning eight different consumer goods in a European country in 2004 and 2008.

Overall, televisions and telephones were the most commonly owned items in both years, whereas dishwashers had the lowest ownership rates. Most categories experienced an increase over the period, while telephone ownership showed a slight decline.

In 2004, around 90% of households owned a television, rising slightly to approximately 95% in 2008. Telephone ownership, however, fell marginally from about 95% to just under this figure in the final year. Ownership of microwaves and CD players also increased moderately, from roughly 65% to 70% and from 72% to around 76% respectively.

Among the remaining items, mobile phones and home computers saw the most dramatic growth. Mobile phone ownership rose sharply from approximately 30% in 2004 to about 85% in 2008, representing the largest increase on the chart. Similarly, the percentage of households with a home computer almost doubled, climbing from around 38% to 75%.

By contrast, dishwashers and clothes dryers showed only modest increases. Dishwasher ownership grew from about 25% to 30%, while clothes dryer figures rose slightly from around 60% to 65%.

The charts below give information about the price of tickets on one airline between Sydney and Melbourne, Australia, over a two-week period in 2013.

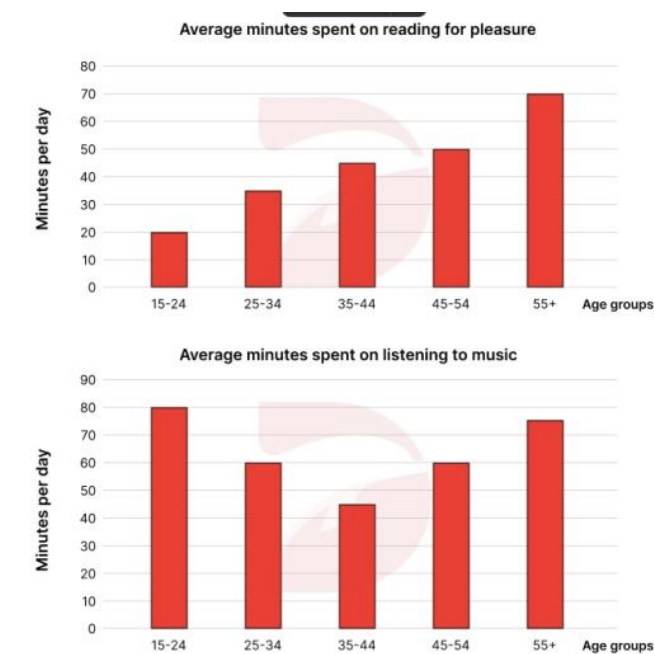

The bar charts compare airline ticket prices for flights between Sydney and Melbourne over a two-week period in 2013.

Overall, ticket prices on both routes followed a similar pattern throughout the two weeks. Fares were generally lowest between Tuesday and Thursday, while the highest prices were usually recorded on Fridays and weekends. In addition, flights from Sydney to Melbourne tended to be more expensive than those travelling in the opposite direction.

For flights from Sydney to Melbourne, prices stood at \$80 on Monday of week 1 before dropping sharply to \$35 on Tuesday and Wednesday. They then increased gradually to \$40 on Thursday and peaked at \$75 on Friday. After that, fares fell slightly to \$65 on Saturday and \$50 on Sunday. In week 2, prices were overall lower and more stable, remaining at \$35 from Tuesday to Wednesday before rising to \$75 on Friday and declining again over the weekend.

Regarding the Melbourne-to-Sydney route, ticket prices showed a comparable trend. In week 1, fares began at \$60 on Monday, stayed constant at \$35 from Tuesday to Thursday, and then climbed dramatically to \$80 on Friday. Prices subsequently decreased to \$60 on Saturday and \$50 on Sunday. During week 2, most fares were lower than those in the previous week, with Friday prices dropping to \$60 and Monday fares falling to \$40, while Sunday prices remained unchanged at \$50. **(Total words: 219)**

3. The charts give information about the average amount of time per day spent on two common leisure activities of different age groups in New Zealand.

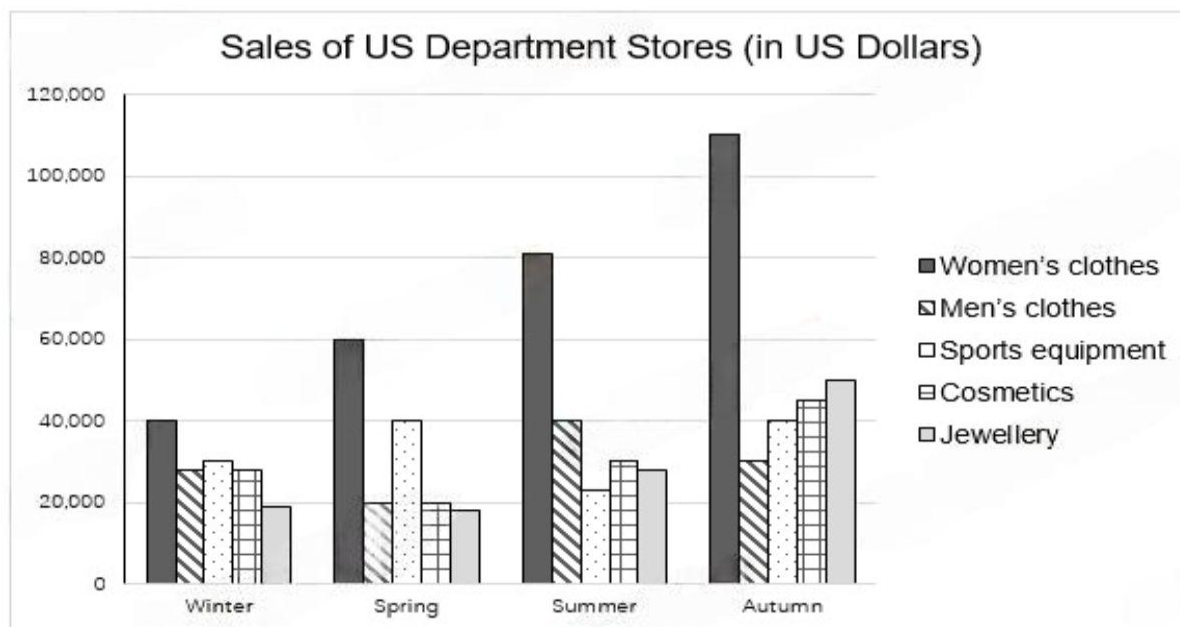

The two bar charts compare the average number of minutes per day spent on reading for pleasure and listening to music among five age groups in New Zealand.

Overall, time spent reading increases steadily with age, whereas listening to music is most popular among the youngest and oldest groups. Younger people generally spend far more time listening to music than reading, while older adults devote substantial time to both activities.

Regarding reading for pleasure, the average time rises consistently across all age groups. People aged 15–24 spend the least time reading, at approximately 20 minutes per day. The figure then climbs to around 35 minutes for those aged 25–34 and continues to increase to 45 and 50 minutes among the 35–44 and 45–54 groups respectively. The highest amount of reading time is recorded among individuals aged 55 and over, at about 70 minutes daily.

By contrast, the pattern for listening to music is less consistent. The youngest age group spends the greatest amount of time on music, averaging roughly 80 minutes per day. This figure declines gradually to 60 minutes for the 25–34 and 45–54 groups, before reaching a low of about 45 minutes among people aged 35–44. However, listening time rises again among those aged 55 and above, reaching approximately 75 minutes per day.

Bar Chart The graph shows the sales of five types items in four different seasons at a departmental store in the us in 2011.

The bar chart compares the sales revenue generated from five categories of products in four seasons at a department store in the US in 2011.

Overall, women's clothing was by far the best-selling category throughout the year, with sales increasing steadily from winter to autumn. By contrast, jewellery generally recorded the lowest figures, although it experienced a significant rise in autumn. Another notable feature is that sales of sports equipment remained relatively stable compared to the other products.

In winter, women's clothes generated approximately \$40,000 in sales, while men's clothes, sports equipment and cosmetics all earned around \$30,000. Jewellery was the least popular item, accounting for only \$20,000.

In spring, sales of women's clothing rose considerably to about \$60,000, which was three times higher than the figures for men's clothes and cosmetics, both at roughly \$20,000. Sports equipment performed relatively well, reaching around \$40,000, whereas jewellery sales remained slightly below \$20,000.

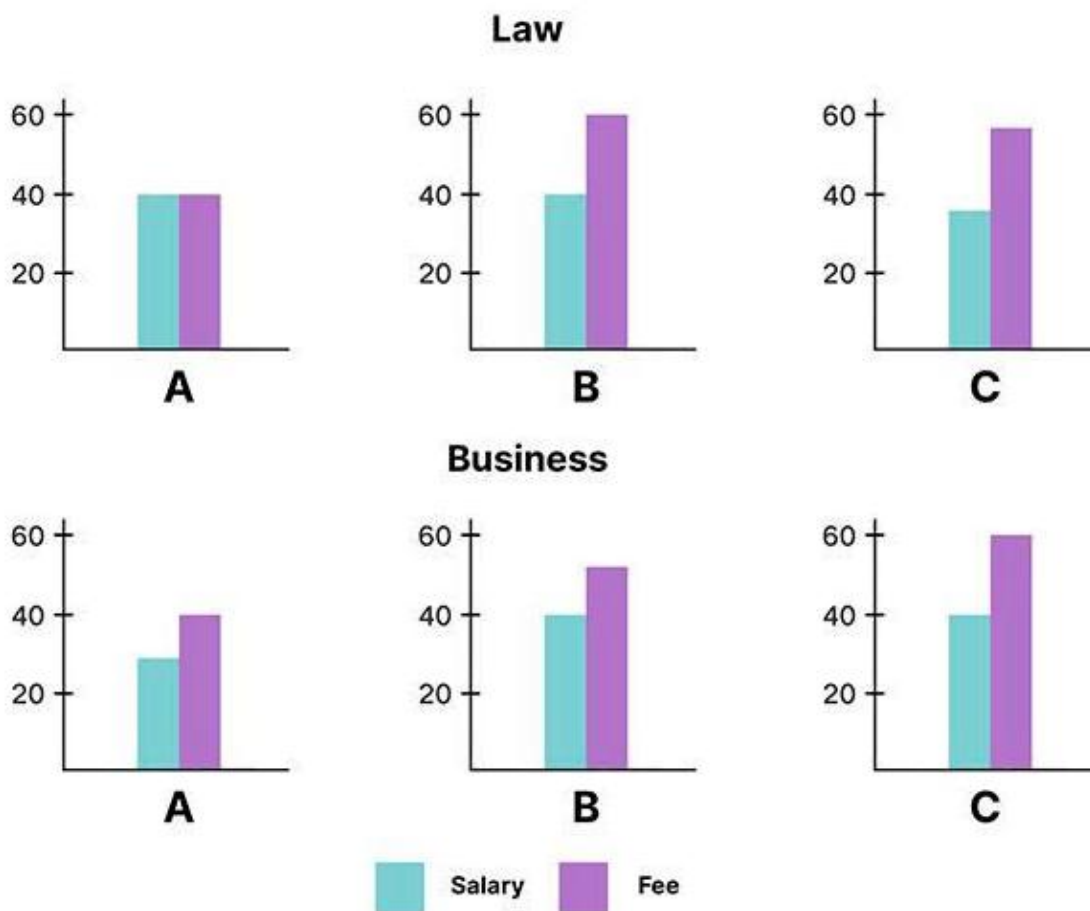

During summer, the revenue from women's clothes continued to increase, reaching approximately \$80,000. Men's clothing sales doubled to around \$40,000, while cosmetics and

jewellery recorded similar figures of about \$30,000. Sports equipment, however, fell to just over \$20,000.

By autumn, women's clothing peaked at roughly \$110,000, the highest figure shown on the chart. Jewellery sales also rose dramatically to nearly \$50,000, overtaking all categories except women's clothes. Meanwhile, men's clothes, sports equipment and cosmetics recorded moderate sales ranging between \$30,000 and \$45,000. (repeated)

Bar Chart The bar charts give information about the salaries and university fees of students from three universities in two spheres-Law and Business.

**Average salaries of university students and the fees they pay
(thousands of dollars)**

The bar charts compare the average salaries earned by graduates and the university fees paid by students at three universities (A, B and C) in two subjects: Law and Business, measured in thousands of dollars.

Overall, graduates from University C earned the highest salaries in both disciplines, while University A generally recorded the lowest figures. In addition, tuition fees tended to be higher than salaries in most cases, particularly in Law at Universities B and C.

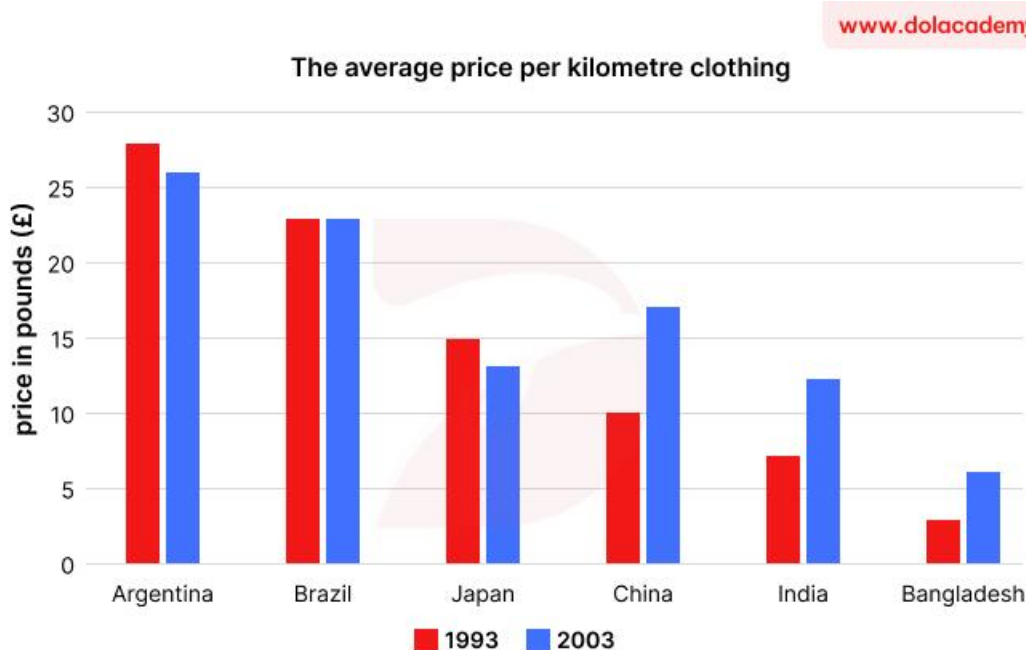

In the field of Law, both the salary and the fee at University A were equal at approximately \$40,000. At University B, graduates earned around \$40,000, whereas the tuition fee was significantly higher at about \$60,000. A similar pattern can be seen at University C, where salaries stood at roughly \$35,000 compared to fees of nearly \$55,000.

Regarding Business, University A recorded the lowest salary figure at around \$30,000, while students paid approximately \$40,000 in fees. At University B, the average salary increased to about \$40,000, with fees reaching just above \$50,000. University C showed the highest figures overall, as graduates earned around \$40,000 and tuition fees peaked at approximately \$60,000.

Overall, Business students generally paid higher fees than Law students, while salary levels remained comparatively lower in several cases.

The bar chart shows the average prices per kilometre of clothing imported into the European Union from six different countries in 1997 and 2003.

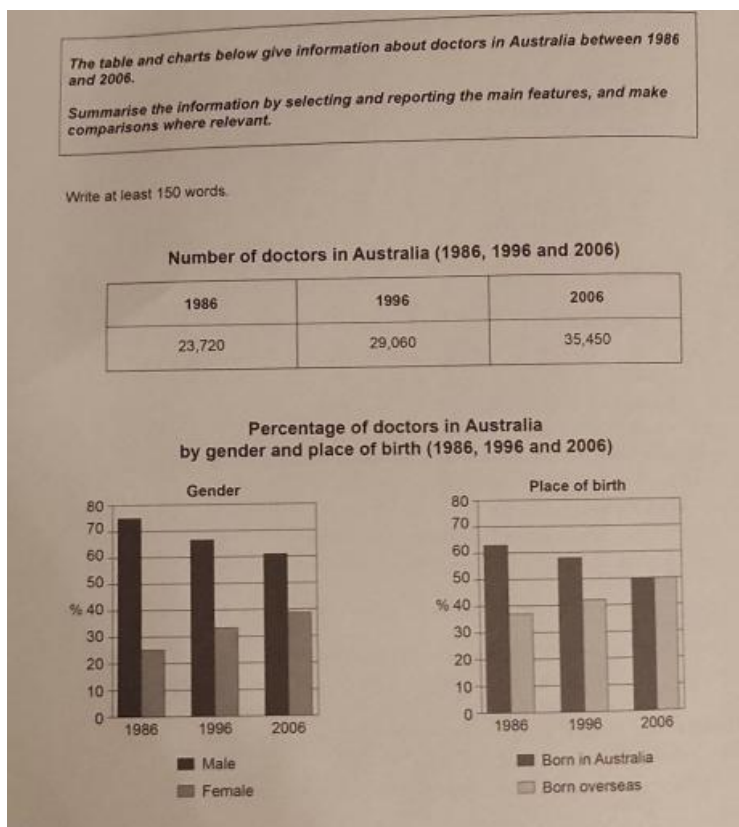

The bar chart compares the average prices of clothing imported into the European Union from six countries in 1993 and 2003.

Overall, Argentina recorded the highest clothing prices in both years, whereas Bangladesh remained the cheapest supplier. While prices in Argentina and Japan declined slightly over the period, those in China, India, and Bangladesh increased considerably. Meanwhile, the figure for Brazil remained unchanged.

In 1993, Argentina had the highest import price at £28, followed by Brazil at £23. Although Argentina's figure fell modestly to £26 in 2003, it continued to be the most expensive source of clothing imports. Brazil, by contrast, maintained a stable price of £23 throughout the decade. Japan also experienced a slight decline, with its figure decreasing from £15 to £13.

Conversely, substantial increases were observed in China, India, and Bangladesh. China's clothing prices rose sharply from £10 in 1993 to £17 in 2003, surpassing Japan by the end of the period. Similarly, India saw a notable increase from £7 to £12. Bangladesh, despite remaining the least expensive supplier, experienced the most dramatic proportional growth, with prices doubling from £3 to £6 over the ten-year period.

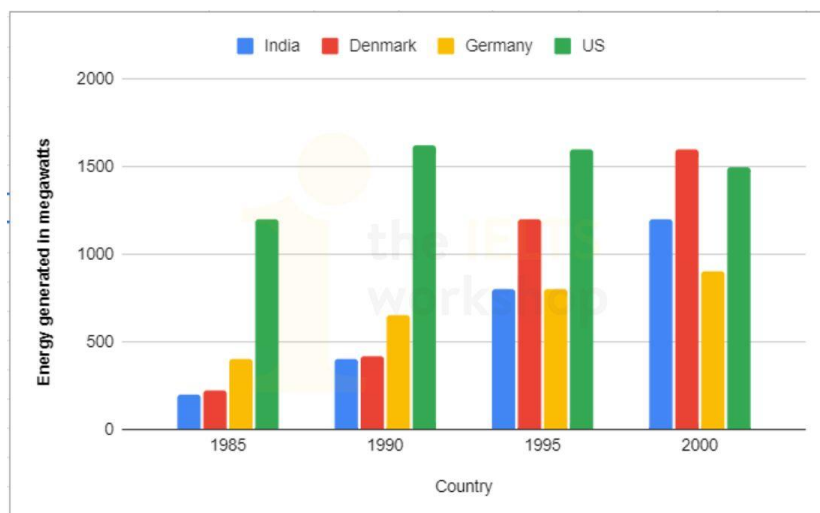

The table and bar charts provide information about the number of doctors in Australia in 1986, 1996 and 2006, as well as the percentages of doctors by gender and place of birth during the same period.

Overall, the total number of doctors in Australia increased steadily over the twenty-year period. In addition, the proportions of female doctors and overseas-born doctors both rose gradually, although male and Australian-born doctors still accounted for the larger shares in all three years.

According to the table, the number of doctors grew from 23,720 in 1986 to 29,060 in 1996, before reaching 35,450 in 2006. This represents an overall increase of nearly 12,000 doctors over the period.

Regarding gender, male doctors made up approximately 75% of the workforce in 1986, compared with only 25% for females. However, the percentage of women increased steadily to around 35% in 1996 and almost 40% in 2006. Consequently, the proportion of male doctors declined gradually to just above 60% by the end of the period.

A similar trend can be observed in terms of place of birth. In 1986, around 63% of doctors were born in Australia, while about 37% were born overseas. By 2006, the proportions had become equal at approximately 50% each.

The bar chart shows the amount of energy generated by wind in four countries from 1985 to 2000.

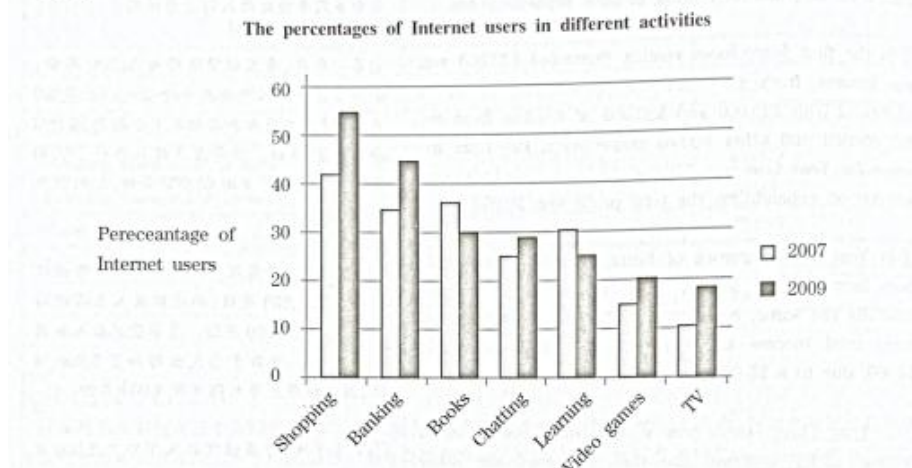

The bar chart illustrates the amount of energy generated from wind in four countries—India, Denmark, Germany and the United States—between 1985 and 2000, measured in megawatts.

Overall, wind energy production increased in all four countries during the period. The United States produced the highest amount at the beginning, while Denmark became the leading producer by 2000. India remained the smallest producer initially but showed steady growth throughout the years.

In 1985, the US generated about 1,200 megawatts of wind energy, which was far higher than the figures for the other countries. Germany produced around 400 MW, whereas Denmark and India generated approximately 250 MW and 200 MW respectively. By 1990, energy production had risen in every nation, with the US reaching about 1,600 MW. Germany also increased to around 650 MW, while Denmark and India rose more moderately.

In 1995, Denmark's wind energy output climbed sharply to roughly 1,200 MW, while Germany and India both produced about 800 MW. By 2000, Denmark became the largest producer at around 1,700 MW, despite a slight fall in the US figure to about 1,500 MW. Germany and India continued to increase gradually, reaching approximately 900 MW and 1,200 MW respectively.

The chart below shows the percentages of Internet users in different activities in a UK city in 2007 and 2009.

Bar Chart

The chart below shows the percentages of Internet users in different activities in a UK city in 2007 and 2009.

The bar chart compares the percentages of people who used the internet for seven different purposes in a particular city in the UK in 2007 and 2009.

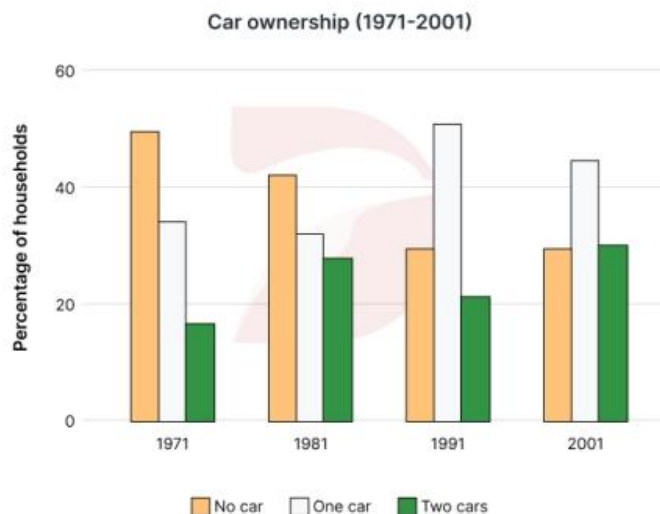

Overall, the proportions of internet users engaging in shopping, banking, chatting, playing video games and watching TV increased over the period, with the most significant growth seen in shopping and banking. By contrast, the percentages of users accessing the internet for educational purposes, such as reading books and learning, declined slightly.

In 2007, shopping was already one of the most common online activities, accounting for just over 40% of internet users. This figure rose markedly to around 55% in 2009, making it the most popular activity overall. A similar upward trend was observed in online banking, which increased from approximately 35% in 2007 to about 45% in 2009. The proportion of users who engaged in chatting also grew moderately, rising from around 25% to nearly 30%.

By contrast, the percentages of people using the internet to read books and for learning purposes both declined over the two-year period. The figure for reading books dropped from roughly 37% to about 30%, while the proportion of users using the internet for learning decreased slightly from around 30% to approximately 27%. Meanwhile, playing video games and watching TV remained relatively less common activities, although both experienced modest increases, reaching approximately 20% and around 18% respectively by 2009.

Bar Chart

The chart below shows the changes in the percentage of households with cars in one European country between 1971 and 2001.

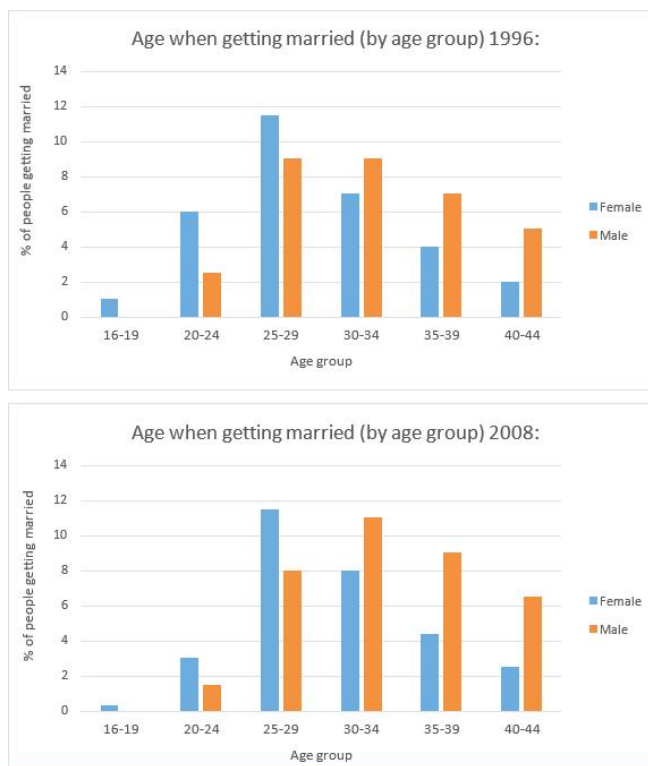

The bar chart illustrates the changes in car ownership among households in a European country between 1971 and 2001.

Overall, car ownership showed an upward trend over the 30-year period. The percentage of households without a car declined steadily, whereas the proportions of households owning one or two cars increased considerably. By the end of the period, one-car households had become the most common category.

In 1971, approximately 50% of households did not own a car, while around 35% possessed one car. By contrast, households with two cars accounted for only about 15%, making this the least common category. This suggests that living without a car was relatively common at the beginning of the period.

Over the following decades, the proportion of carless households fell significantly, reaching roughly 30% in 2001. Meanwhile, the percentage of households owning one car increased steadily, peaking at around 50% in 1991 before declining slightly to approximately 45% in 2001. In addition, two-car ownership became increasingly popular throughout the period, rising gradually from about 15% in 1971 to around 30% by the end of the survey period.

The charts above give information on the ages of people when they got married in one country in 1996 and 2008.

The bar charts compare the percentages of men and women getting married in six different age groups in one country in 1996 and 2008.

Overall, women tended to marry at a younger age than men in both years, while the average age of marriage for both genders increased over time. The highest proportions of marriages occurred among people aged between 25 and 34.

In the youngest age group (16–19), only about 1% of women got married in 1996, and this figure fell to almost zero in 2008. No men in this age category got married in either year. Among women, the most common age for marriage was 25–29, accounting for just under 12% in both years. However, the proportion of women marrying at ages 20–24 declined from around 6% in 1996 to approximately 3% in 2008. By contrast, the figures for the older age groups increased slightly over the period.

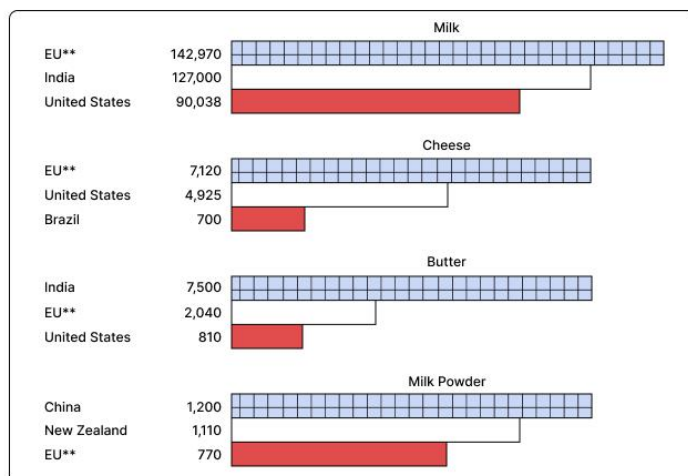

Regarding men, the percentages of those getting married at older ages rose noticeably between 1996 and 2008. In 1996, around 9% of men married at ages 25–29 and 30–34. By 2008, the figure for the 30–34 age group had increased significantly to about 11%, making it the most common age range for male marriage. Similarly, the percentages for the 35–39 and 40–44 groups rose from roughly 7% to 9% and from 5% to around 6.5%, respectively.

The charts below give information about the world's top three producers of four different dairy products in 2012.

The charts below give information about the world's top three producers for four different dairy products (milk, cheese, butter, milk powder) in the year of 2012.

Dairy Production in MT* - top three world producers, 2012

*MT = Metric tons, 1MT = 1000kg
 **EU = European Union

The charts compare the world's top three producers of four dairy products — milk, cheese, butter, and milk powder — in 2012, measured in metric tons (MT).

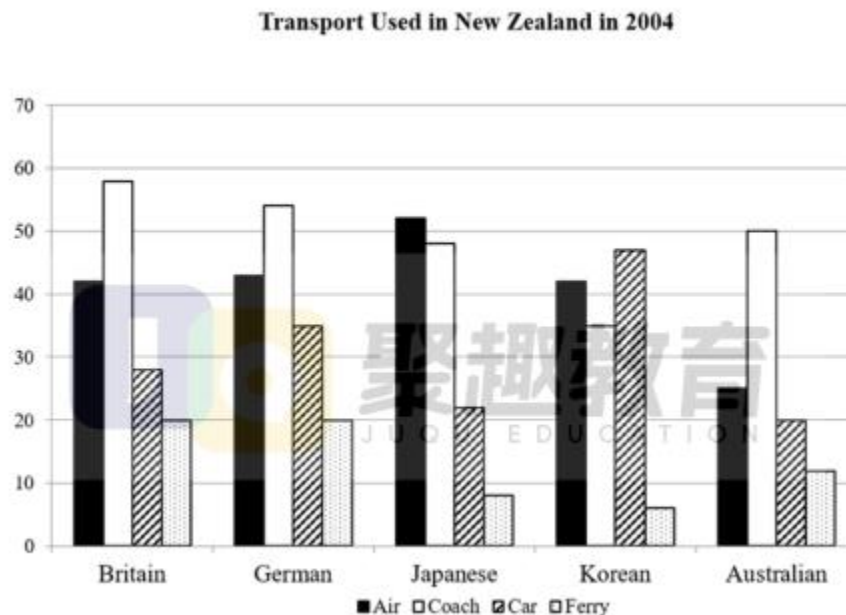

Overall, the EU was the largest producer of both milk and cheese, whereas India and China ranked first in butter and milk powder production respectively. In addition, milk production was substantially higher than that of the other dairy products.

In terms of milk production, the EU ranked first with approximately 143,000 MT, followed by India at 127,000 MT. The United States produced the least among the three countries, at about 90,000 MT. A similar pattern can be seen in cheese production, where the EU manufactured around 7,120 MT, exceeding the US figure by roughly 2,000 MT and producing more than ten times as much as Brazil.

Regarding butter, India was by far the leading producer, with about 7,500 MT, which was almost four times higher than the EU's output of 2,040 MT. The US produced the smallest amount, at only around 810 MT. As for milk powder, production figures were relatively close, ranging from 770 MT in the EU to 1,200 MT in China, while New Zealand recorded approximately 1,110 MT.

Bar Chart

The chart below shows various transport tourists used within New Zealand in 2004.

The bar chart illustrates the percentages of tourists from five countries — Britain, Germany, Japan, Korea and Australia — who used four forms of transport (air, coach, car and ferry) while travelling in New Zealand in 2004.

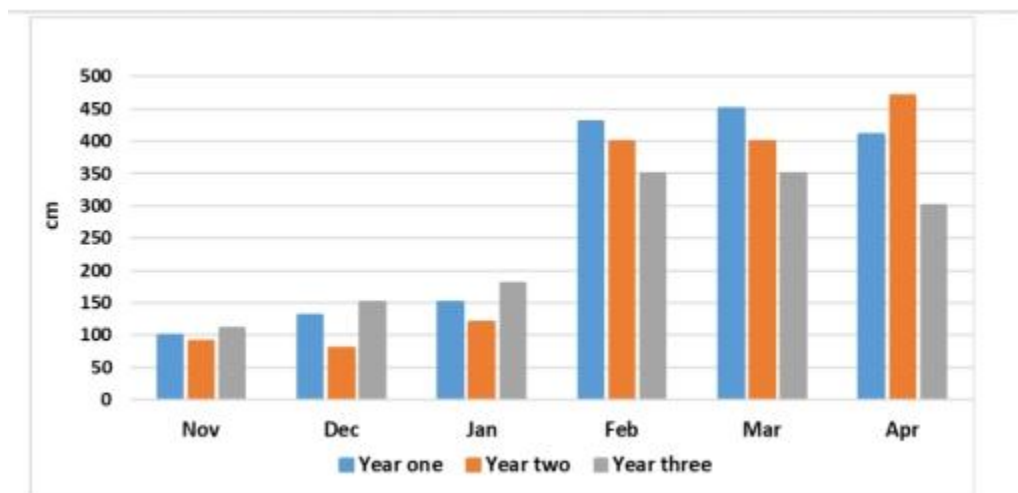

Overall, coaches were the most commonly used means of transport among British, German and Australian visitors, whereas Japanese tourists preferred air travel. In contrast, Koreans recorded the highest proportion of car use. Ferry transport was the least popular option across all five nationalities.

Looking first at British and German tourists, coach travel accounted for the largest shares, at approximately 58% and 54% respectively. Air travel ranked second in both groups, with figures of around 42% for Britain and 43% for Germany. Car use was less common, representing about 28% among British visitors and 35% among Germans. Ferry transport, meanwhile, was chosen by only around one fifth of tourists from both countries.

A different pattern can be seen among Japanese and Korean visitors. Just over half of Japanese tourists travelled by air, compared with roughly 48% who used coaches and 22% who travelled by car. By comparison, Koreans were most likely to travel by car, at about 47%, while the proportions using air and coaches stood at approximately 42% and 35% respectively. Among Australians, coaches were again the dominant mode at around 50%, double the figure for air travel. Ferry use remained comparatively low in every group, ranging from about 7% in Korea to 20% in Britain and Germany.

Bar Chart

The chart below shows the depth of snow (cm) in a particular ski resort in Canada in three different years.

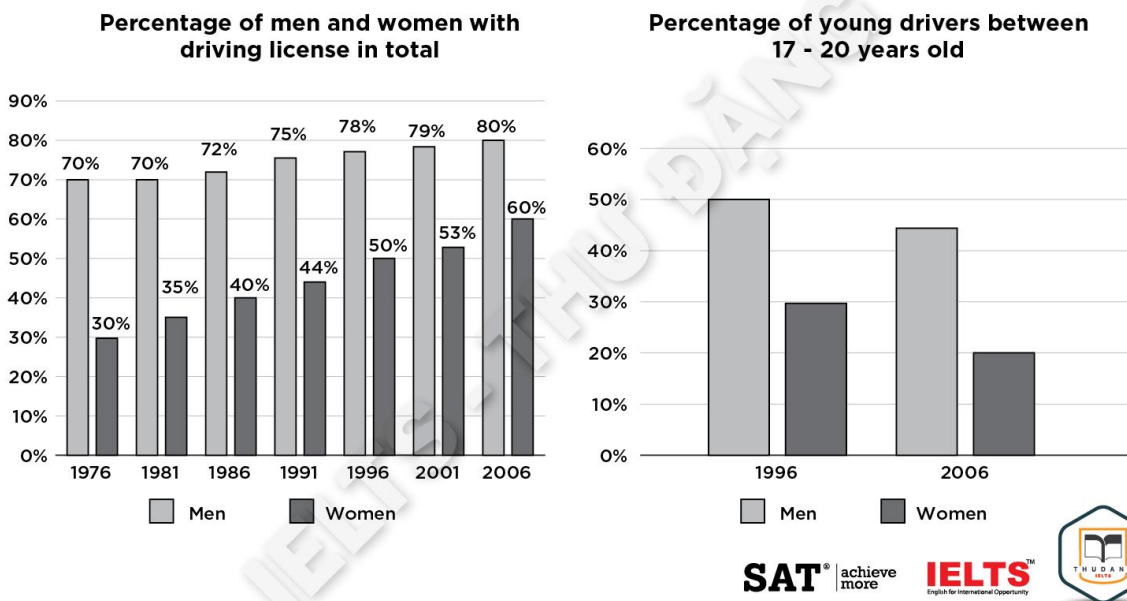

The bar chart compares snow depth, measured in centimetres, at a ski resort in Canada between November and April over three different years.

Overall, snow levels increased considerably from November to late winter in all three years, with the highest figures generally recorded in March or April. Year Three consistently experienced lower snow depths than the other two years, particularly towards the end of the period.

In November, snow depth was relatively low and similar across the three years, at around 90–110 cm. The figures then rose gradually in December and January. In Year One, snow depth increased from approximately 130 cm in December to 150 cm in January, while the corresponding figures for Year Three were about 150 cm and 180 cm respectively. Year Two showed a lower level of snowfall during these months, recording around 80 cm in December and 120 cm in January.

A sharp increase occurred in February, when snow depth climbed to roughly 430 cm in Year One and 400 cm in Year Two. By contrast, Year Three recorded a lower figure of approximately 350 cm. In March, Year One reached its peak at around 450 cm before falling slightly to just above 400 cm in April. Meanwhile, Year Two remained stable at 400 cm in March before rising dramatically to nearly 480 cm in April, the highest figure shown on the chart. Snow depth in Year Three, however, declined from about 350 cm in March to 300 cm in April.

The bar chart shows the percentage of men and women in Great Britain who had driving licenses and another bar chart shows the percentage of men and women who were young drivers at the age of 17-20.

The bar charts compare the percentages of men and women in Great Britain who held driving licences between 1976 and 2006, and also show the proportions of young drivers aged 17–20 in 1996 and 2006.

Overall, the percentage of people holding driving licences increased steadily for both genders over the 30-year period. Men consistently recorded higher figures than women, although the gap narrowed considerably over time. By contrast, the proportions of young drivers declined between 1996 and 2006.

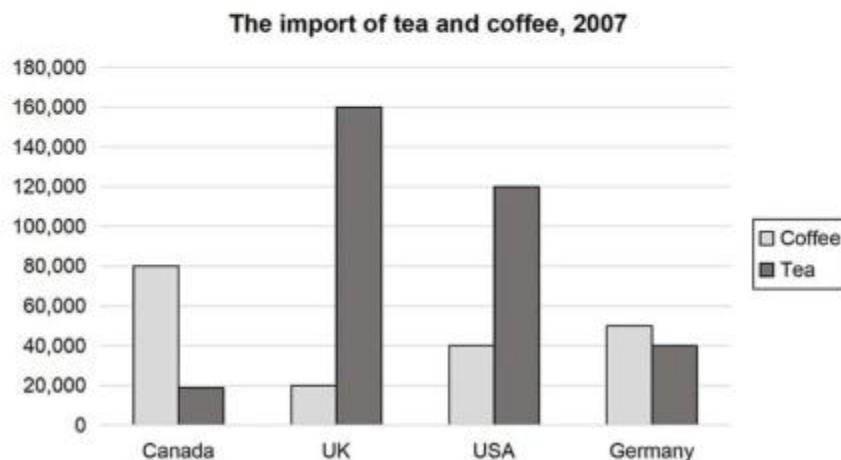

In 1976, 70% of men possessed driving licences, compared with only 30% of women. The figure for men remained unchanged in 1981 before rising gradually to reach 80% in 2006. Meanwhile, the percentage of women with licences increased more noticeably throughout the period, climbing from 30% to 60%. As a result, the gender gap fell significantly from 40 percentage points in 1976 to 20 points by the end of the period.

Regarding young drivers aged 17–20, men again accounted for a higher proportion than women in both years shown. In 1996, 50% of young men held driving licences, compared with 30% of young women. Ten years later, both figures had declined, with the percentage for men falling moderately to 45%, while the figure for women dropped more sharply to 20%.

The graph below shows the amount of tea and coffee imported by four different countries in tonnes in 2007.

Summarise the information by selecting and reporting the main features, and make comparison where relevant.

Write at least 150 words.

The bar chart compares the amounts of tea and coffee imported by Canada, the UK, the USA and Germany in 2007, measured in tonnes.

Overall, tea imports were considerably higher than coffee imports in the UK and the USA, whereas the opposite pattern can be seen in Canada and Germany. Among the four countries, the UK imported by far the largest quantity of tea, while Canada purchased the most coffee.

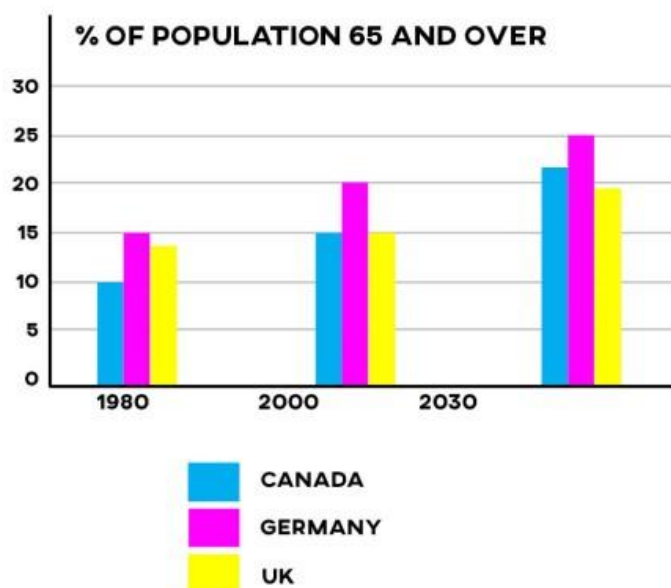

In terms of coffee imports, Canada ranked first at approximately 80,000 tonnes. Germany followed with around 50,000 tonnes, while the USA imported roughly 40,000 tonnes. The UK recorded the lowest figure for coffee, at only about 20,000 tonnes.

Regarding tea, the UK was the dominant importer, purchasing approximately 160,000 tonnes, which was far higher than the figures for the other countries. The USA ranked second with about 120,000 tonnes of tea imports. By comparison, Germany imported around 40,000 tonnes, while Canada recorded the lowest amount at just 20,000 tonnes.

Overall, the gap between tea and coffee imports was particularly noticeable in the UK and the USA, where tea imports greatly exceeded those of coffee. **(Repeated)**

The bar chart shows the percentage of elderly citizens in three countries in 1980, 2000, and 2030.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

The bar chart compares the percentages of people aged 65 and over in Canada, Germany and the UK in 1980 and 2000, together with projections for 2030.

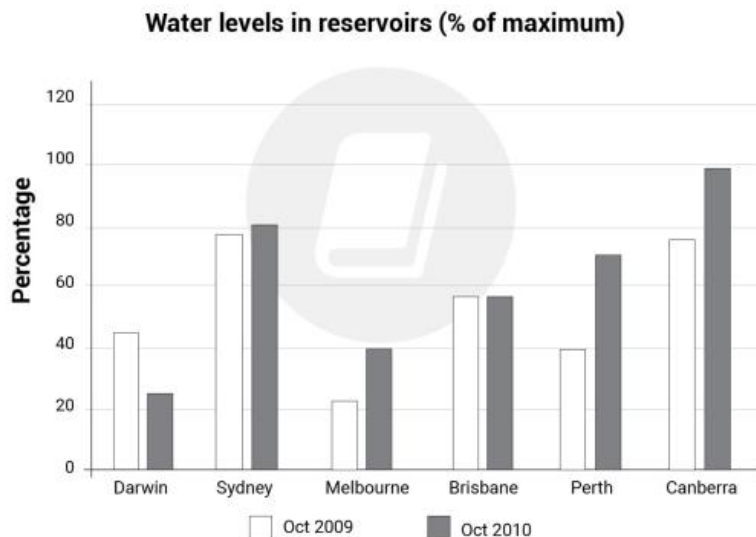

Overall, the proportion of elderly people increased in all three countries and is expected to continue rising by 2030. Germany recorded the highest percentages throughout the period, while the UK had the lowest projected figure in 2030.

In 1980, Germany had the largest elderly population, with approximately 15% of its citizens aged 65 or above. The figure for the UK was slightly lower at around 14%, whereas Canada recorded the smallest proportion, at 10%.

By 2000, the percentages in both Canada and Germany had risen by 5 percentage points, reaching 15% and 20% respectively. In contrast, the UK saw almost no change, remaining at about 15%.

Further growth is predicted by 2030. Germany is expected to maintain the highest proportion of elderly citizens at roughly 25%, while Canada is forecast to increase significantly to around 22%, overtaking the UK. Meanwhile, the percentage in the UK is projected to rise more moderately to approximately 19%.

The chart below shows the water levels of 6 cities in Australia in October 2009 and 2010

The bar chart compares reservoir water levels, expressed as percentages of maximum capacity, in six Australian cities in October 2009 and October 2010.

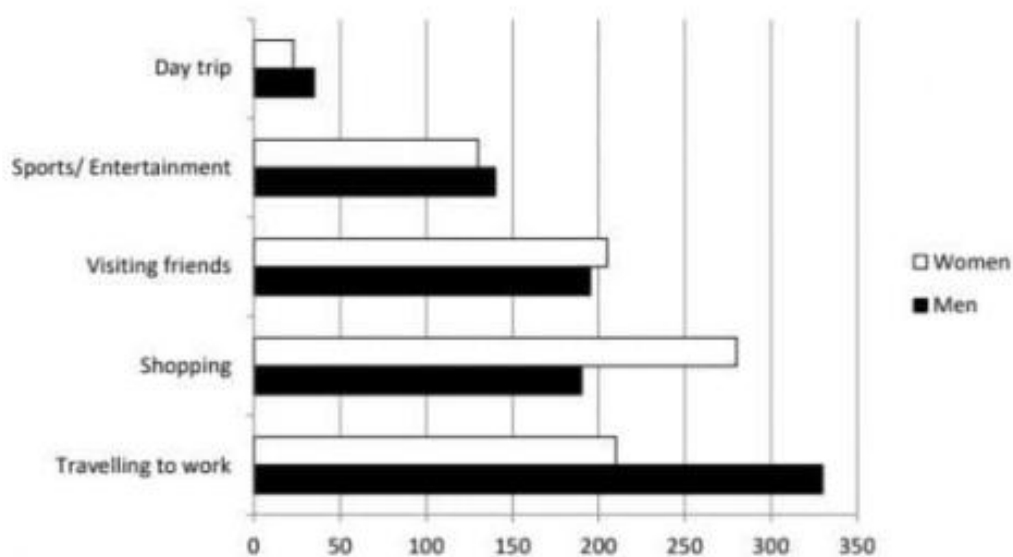

Overall, water levels increased in most cities over the period, with Canberra and Sydney recording the highest proportions in both years. By contrast, Darwin was the only city to experience a decline, while Brisbane remained unchanged.

In October 2009, Canberra had the highest reservoir level at approximately 75%, closely followed by Sydney at around 75% as well. Brisbane recorded a moderate figure of about 55%, whereas Darwin and Perth stood at roughly 45% and 40% respectively. Melbourne had the lowest proportion, at just over 20%.

By October 2010, Canberra's water level had risen dramatically to just below 100%, the highest figure shown on the chart. Sydney also experienced a slight increase to around 80%. Perth and Melbourne recorded notable growth, climbing to approximately 70% and 40% respectively. In contrast, Darwin's reservoir level fell sharply to about 25%, while Brisbane remained stable at roughly 55% in both years.

Bar Chart

The chart gives information about the number and purposes of trips made by men and women in one year in a certain European country.

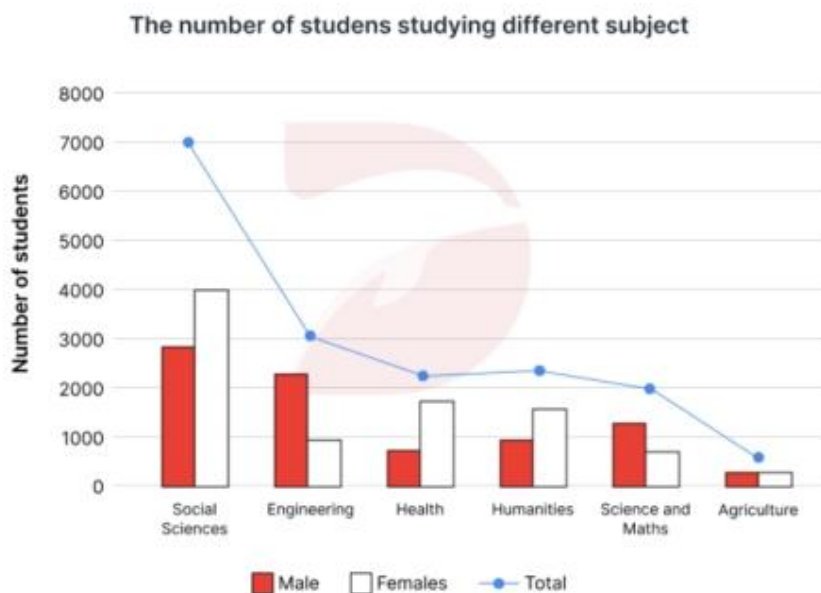

The bar chart compares the number of trips made by men and women for five different purposes in a European country over the course of one year.

Overall, travelling to work was the most common reason for trips among men, whereas women made the highest number of journeys for shopping. In contrast, day trips accounted for the lowest figures for both genders.

Looking first at the less common purposes, day trips were relatively rare, with women making approximately 25 trips and men around 30. Similarly, the figures for sports and entertainment were fairly close, at about 125 for women and 140 for men. Visiting friends was also a popular activity, particularly among women, who made roughly 210 trips compared with around 190 by men.

More noticeable differences can be seen in shopping and commuting. Women made by far the highest number of shopping trips, at approximately 280, which was considerably higher than the figure for men at around 190. By contrast, work-related travel was dominated by men, whose figure reached roughly 330 trips, compared with just over 200 among women.

The graph and the chart below show the number of students choosing different kinds of courses in a particular university in 2012.

The chart compares the numbers of male and female students studying six different subjects in 2012, while the line graph shows the total number of students in each subject.

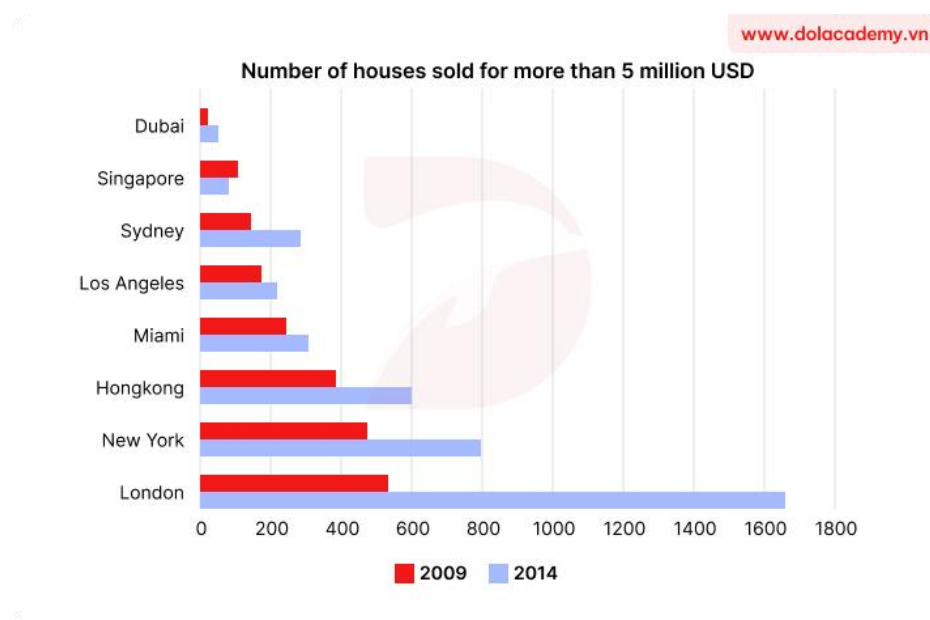

Overall, Social Sciences had by far the highest number of students, whereas Agriculture recorded the lowest figure. In most subjects, female students outnumbered males, with Engineering being the main exception.

In Social Sciences, the total number of students stood at approximately 7,000, including around 4,000 females and 3,000 males. Engineering ranked second with about 3,000 students overall, and male students accounted for the majority at roughly 2,300, compared with only around 1,000 females.

Health and Humanities recorded similar totals of just over 2,000 students each. In both subjects, women outnumbered men, with female figures of approximately 1,700 in Health and 1,600 in Humanities. By contrast, male enrolments were below 1,000 in both categories.

Science and Maths had a total of around 2,000 students, most of whom were male. Agriculture had the fewest students overall, at only about 500, and the numbers of men and women were almost equal.

The bar chart shows the number of homes, each worth 5 million dollars or more, sold in eight cities.

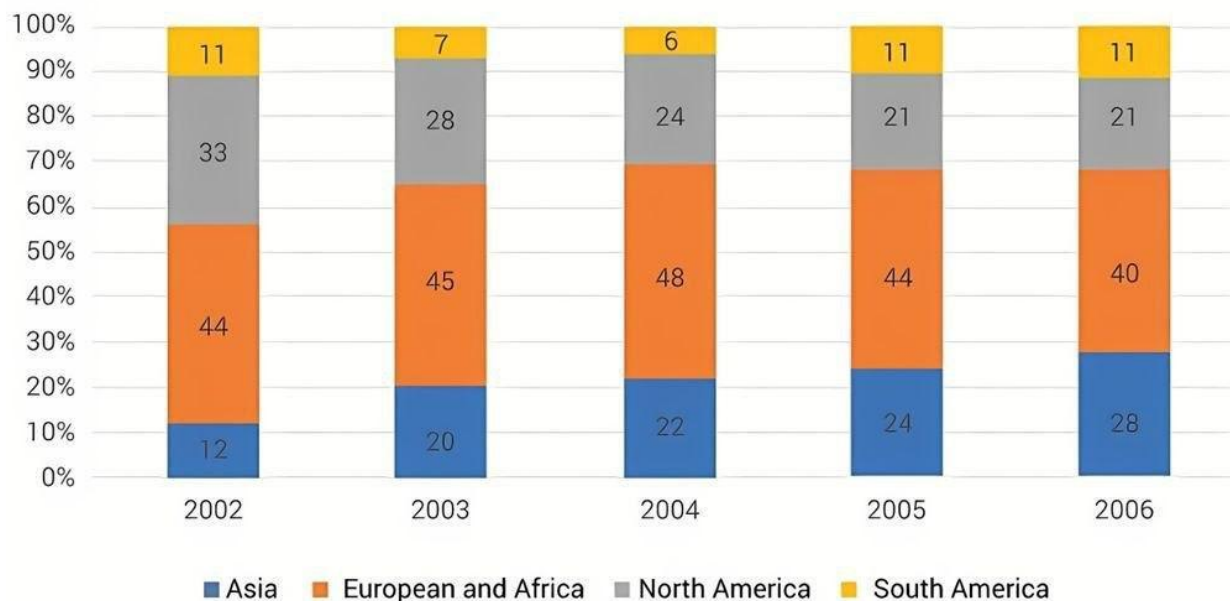

The bar chart compares the number of houses worth more than 5 million USD sold in eight cities in 2009 and 2014.

Overall, sales of luxury properties increased in nearly all cities over the period, with Singapore being the only exception. London recorded by far the highest number of sales in both years, whereas Dubai consistently had the fewest transactions.

In 2009, London led the market with approximately 500 luxury homes sold, slightly ahead of New York at around 480. Hong Kong ranked third with about 400 sales, followed by Miami at roughly 250. Los Angeles and Sydney recorded similar figures of around 180–200 sales each. By contrast, Singapore and Dubai had relatively small numbers, at approximately 100 and 10 respectively.

By 2014, sales figures had risen substantially in most cities. London experienced the most dramatic growth, with sales climbing to approximately 1,650, more than tripling the 2009 figure. New York and Hong Kong also saw considerable increases, reaching around 800 and 600 sales respectively. More moderate growth was observed in Miami, Sydney and Los Angeles. Meanwhile, Dubai's figure rose fivefold to about 50 sales, while Singapore was the only city to witness a decline, falling slightly to roughly 75 homes sold.

The chart below shows the percentage of a drug company's total sales, by region, from 2002 to 2006.

The stacked bar chart illustrates the percentage of a pharmaceutical company's total sales generated from four regions — Asia, Europe and Africa, North America, and South America — between 2002 and 2006.

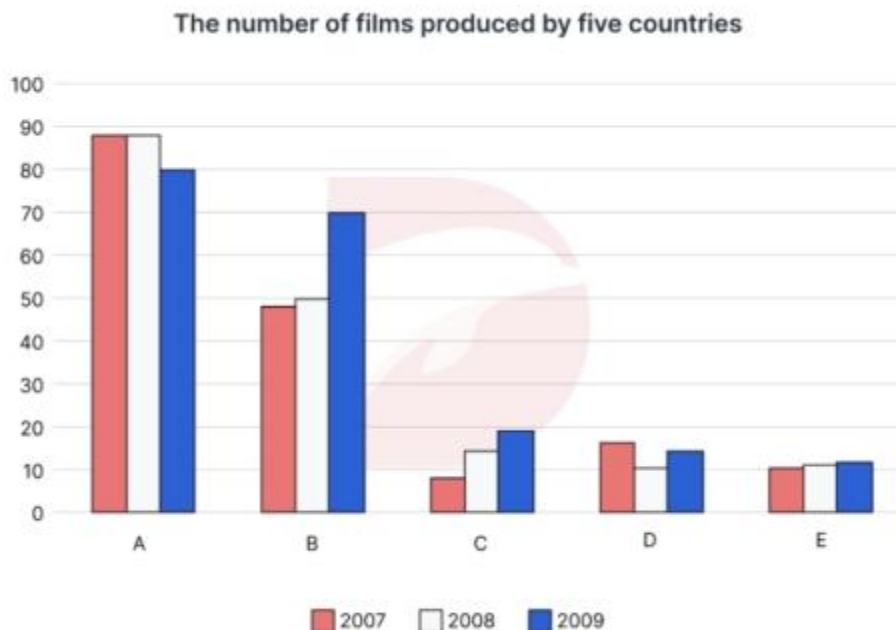

Overall, Europe and Africa contributed the largest proportion of sales throughout the period, while Asia showed a steady increase. By contrast, North America experienced a gradual decline, whereas South America remained the smallest market in all years.

In 2002, Europe and Africa accounted for 44% of total sales, followed by North America at 33%. Asia represented only 12%, while South America made up the remaining 11%. Over the next two years, the share of Europe and Africa rose slightly to a peak of 48% in 2004. During the same period, Asia's contribution also increased steadily from 12% to 22%.

Meanwhile, North America's proportion fell continuously from 33% in 2002 to 24% in 2004, before declining further to 21% in both 2005 and 2006. South America showed the lowest figures throughout the period, dropping from 11% in 2002 to 6% in 2004, after which it recovered to 11% again by 2005 and remained unchanged in the final year. (repeated)

Bar Chart

The chart below shows the number of films produced by five countries in three years.

The bar chart compares the number of films produced by five countries between 2007 and 2009.

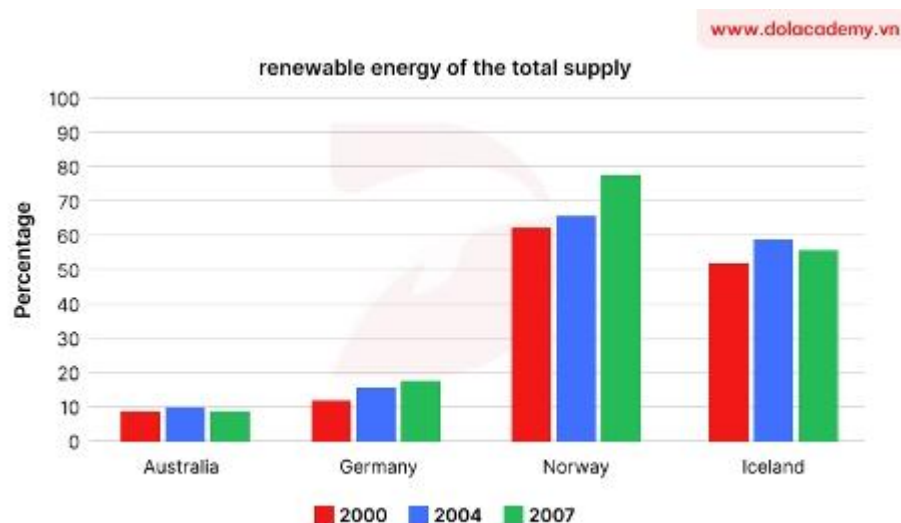

Overall, Country A remained the largest film producer throughout the period despite a slight decline in output. By contrast, film production increased in Countries B, C and E, while Country D experienced a small overall decrease.

In 2007, Country A produced the highest number of films, at approximately 90, which was almost double the figure for Country B at around 48. Much lower numbers were recorded in the remaining countries, with Country D producing about 17 films, followed by Country E at around 10 and Country C at only 8.

Over the following two years, film production in Country A fell modestly to roughly 80 films in 2009. Country D also declined slightly overall, despite recovering from about 10 films in 2008 to approximately 15 in the final year. In contrast, Country B experienced the most significant growth, rising steadily to around 70 films by 2009. Similarly, Countries C and E recorded moderate increases, reaching approximately 19 and 12 films respectively at the end of the period.

Bar Chart

The bar chart below shows the proportion of renewable energy of total supply in 2000, 2004, and 2007.

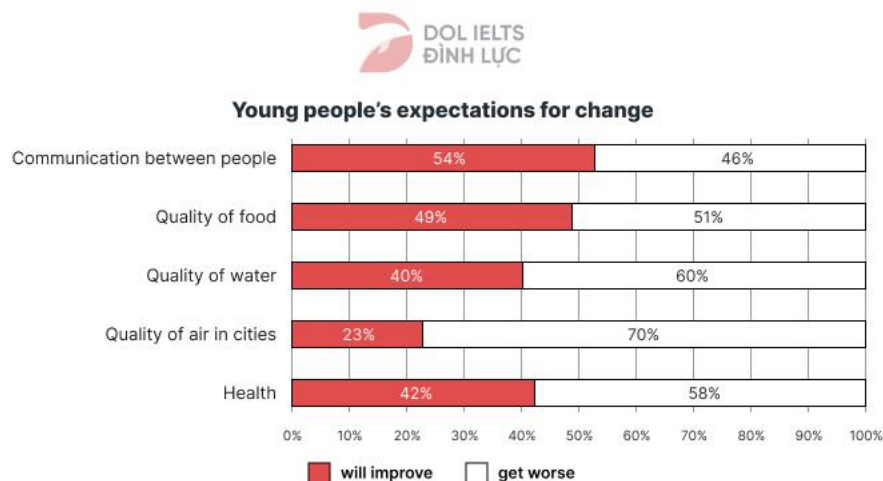

The bar chart compares the proportions of renewable energy in the total energy supply of Australia, Germany, Norway and Iceland in 2000, 2004 and 2007.

Overall, Norway and Iceland recorded far higher percentages of renewable energy than Australia and Germany throughout the period. While the share of renewable energy increased in most countries, the most significant growth occurred in Norway, whereas Australia remained largely unchanged.

In Australia, renewable energy accounted for approximately 10% of the total energy supply in all three years, showing almost no variation over time. Germany, by contrast, experienced a gradual increase, with the figure rising from around 12% in 2000 to nearly 20% in 2007.

Norway and Iceland relied considerably more on renewable sources than the other two countries. In Norway, the proportion climbed steadily from just above 60% in 2000 to almost 80% by 2007, the highest figure shown on the chart. Iceland also recorded relatively high percentages, increasing from roughly 50% in 2000 to around 60% in 2004 before falling slightly to just under 60% in the final year.

The chart below shows the results of a European survey into young people's expectations for change in five different areas of life in the next 20 years. They were asked if they thought things would improve or get worse.

The bar chart presents the results of a survey about young Europeans' expectations regarding whether five aspects of life would improve or deteriorate over the following twenty years.

Overall, communication between people was the only category in which the majority expected improvement, whereas opinions about air quality in cities were the most pessimistic. In most other areas, more respondents believed conditions would worsen rather than improve.

Regarding communication, 54% of young people expected positive developments, compared with 46% who believed it would get worse. Opinions about food quality were almost evenly divided, although slightly more participants predicted deterioration (51%) than improvement (49%).

More negative views were expressed for the remaining categories. In terms of water quality, 60% of respondents anticipated worsening conditions, while only 40% expected improvement. A similar pattern can be observed in health, where 58% believed conditions would deteriorate, compared with 42% who held an optimistic view. Urban air quality received the most negative responses overall, with 70% predicting a decline, whereas only 23% expected improvement.
