

## Task 1 – Table

### ? Introduction (1 sentence)

- Paraphrase the question

#### Template:

The table illustrates/compares/presents information about \_\_\_\_ in terms of \_\_\_\_.

### ? Overview (IMPORTANT – 2 sentences)

- Biggest trends ONLY (no numbers)

#### What to include:

- Highest / lowest
- Increase / decrease
- Striking features

#### Template (simple + safe):

Overall, it is clear that \_\_\_\_ had the highest figure, while \_\_\_\_.  
Additionally, \_\_\_\_ increased, whereas \_\_\_\_ decreased.

### ? Body Paragraph 1

- Group similar data
- Use comparisons

### ? Body Paragraph 2

- Remaining data
- Focus on changes / differences

### ? High-Score Vocabulary (Use These!)

#### ? Increase

- rose
- increased
- grew
- climbed

#### ? Decrease

- fell
- declined
- dropped

#### ? Comparison

- while
- whereas
- compared to
- in contrast

1. The graphs below show the percentage of graduates that got full-time jobs after graduating from a university in Australia, and the average salary of both these types of graduates, from 2004 to 2012.  
(repeated)

Math Graduates and Other Graduates

|                 | 2004     | 2006     | 2008     | 2010     | 2012     |
|-----------------|----------|----------|----------|----------|----------|
| Math Graduates  | \$41,000 | \$43,000 | \$50,000 | \$51,000 | \$56,000 |
| Other Graduates | \$41,000 | \$43,000 | \$45,000 | \$47,000 | \$51,000 |

The line graph and table compare the proportion of Australian graduates securing full-time employment and the average salaries of mathematics graduates and other graduates between 2004 and 2012.

Overall, the employment rate of mathematics graduates remained relatively stable throughout the period, while that of other graduates fluctuated more noticeably. Although both groups started with identical salaries, mathematics graduates experienced faster growth and ended the period earning considerably more.

In terms of employment, around 80% of mathematics graduates obtained full-time jobs in 2004, and this figure remained fairly consistent, peaking slightly at around 85% in 2008 before declining marginally to just under 80% by 2012. By contrast, the proportion of other graduates showed greater variation, rising from approximately 65% in 2004 to a peak of about 90% in 2006, before falling steadily to around 65% again at the end of the period.

Regarding salaries, both groups earned the same amounts in 2004 and 2006, at \$41,000 and \$43,000 respectively. However, from 2008 onwards, mathematics graduates saw a sharper increase, rising from \$50,000 to \$56,000 by 2012. In comparison, the salaries of other graduates grew more gradually, from \$45,000 in 2008 to \$51,000 in the final year.

2. The Pie chart gives information about the country of birth of people living in Australia and the table shows where people born in these countries live.  
(repeated)

The pie chart shows the distribution of people living in Australia by country of birth, while the table compares where these groups live in terms of cities and rural areas.

Overall, the vast majority of Australia's population was born domestically, and people from all backgrounds tended to live predominantly in urban areas. Notably, Chinese-born residents had the highest proportion living in cities, whereas New Zealanders had the largest share in rural areas.

According to the pie chart, 73% of residents were born in Australia. Among overseas-born populations, the largest proportion came from other countries (14%), followed by the UK at 7%. Much smaller shares were recorded for New Zealand (3%), China (2%), and the Netherlands (1%).

Turning to the table, city living was dominant across all groups. An overwhelming 99% of Chinese-born residents lived in urban areas, the highest figure shown. This was followed by people from the Netherlands (90%) and the UK (89%), while 83% of Australian-born individuals resided in cities. By contrast, New Zealanders had the lowest proportion in cities (80%) and the highest percentage living in rural areas, at 20%.

3. The table details the international tourist arrival in millions in 8 countries in 2009 and 2010 and the changes ( in percentages).

| Country   | In 2009<br>(Millions) | In 2010<br>(Millions) | Change |
|-----------|-----------------------|-----------------------|--------|
| France    | 76                    | 76                    | 0      |
| US        | 66                    | 67                    | 1.5%   |
| Spain     | 55                    | 56                    | 1.8%   |
| UK        | 55                    | 57                    | 3.6%   |
| Italy     | 44                    | 45                    | 2.3%   |
| Turkey    | 33                    | 45                    | 33%    |
| China     | 22                    | 34                    | 55%    |
| Germany   | 11                    | 23                    | 109%   |
| Hong Kong | 10                    | 9                     | -11%   |

The table compares the number of international tourist arrivals, measured in millions, in nine countries in 2009 and 2010, along with the percentage change.

Overall, France received the highest number of tourists in both years and experienced no growth, while Germany recorded the most significant increase. In contrast, Hong Kong was the only country to see a decline.

In 2009, France attracted 76 million visitors, a figure that remained unchanged in 2010. The US ranked second, rising slightly from 66 million to 67 million, an increase of 1.5%. Similarly, Spain and the UK both had 55 million visitors in 2009, with small increases to 56 million and 57 million respectively, although the UK saw a higher growth rate of 3.6% compared to Spain's 1.8%. Italy also experienced modest growth, increasing from 44 million to 45 million visitors.

More noticeable changes were observed in other countries. Turkey's tourist numbers rose significantly from 33 million to 45 million, a 33% increase. China also recorded strong growth, climbing from 22 million to 34 million, representing a 55% rise. Germany saw the most dramatic increase, more than doubling from 11 million to 23 million, a rise of 109%. By contrast, Hong Kong was the only country to experience a decline, falling slightly from 10 million to 9 million. (Word count: 219)

4. The graph below shows the information about medical care in three European countries between 1980 and 2000.

|                                    |         | 1980 | 1990 | 2000 |
|------------------------------------|---------|------|------|------|
| Physicians<br>(per 1000 people)    | Austria | 0.8  | 0.9  | 1    |
|                                    | France  | 2.4  | 2.2  | 1.3  |
|                                    | Sweden  | 3.6  | 3    | 3.8  |
| Hospital beds<br>(per 1000 people) | Austria | 1.4  | 3.1  | 3.7  |
|                                    | France  | 0.2  | 0.8  | 1.6  |
|                                    | Sweden  | 6.4  | 6.4  | 6.9  |
| Average stay<br>in hospitals       | Austria | 18   | 6    | 18   |
|                                    | France  | 9    | 7    | 5    |
|                                    | Sweden  | 23   | 18   | 21   |

The table **provides a comparative analysis** of three key indicators of medical care in Austria, France, and Sweden across three decades, specifically in 1980, 1990, and 2000.

Overall, the data indicates a general trend towards increased hospital resources, with the number of beds showing growth in most nations. Crucially, Sweden consistently maintained the highest number of beds and the longest average stay, while France saw the most significant reduction in the average duration of hospital stays.

Regarding the number of physicians per 1,000 people, Sweden reported the highest figures, rising **marginally** from 3.6 to 3.8 over the period. Austria also saw a slight, steady increase from 0.8 to 1. In contrast, France experienced a **notable** decline, starting at 2.4 doctors per 1,000 people and **plummeting** to 1.3 by 2000. Focusing on hospital beds, Sweden's high rate remained **remarkably stable** (around 6.4 to 6.9). Both Austria and France saw a **substantial** increase, with Austria's rate rising from 1.4 to 3.7, and France's rate jumping eight-fold, from 0.2 to 1.6.

Turning to the average length of stay, the general trend was downward. France showed the most **dramatic** drop, falling from 9 days in 1980 to just 5 days in 2000. Sweden had the longest stays in both years (23 and 21 days), reflecting its high number of beds. Austria's data was **volatile**, falling sharply from 18 days in 1980 to 6 days in 1990 before **reverting** to the original figure of 18 days in 2000.

5. The table below shows the total population and the proportion of males and females aged 15 and aged 75 in the UK from 1911 to 2011.

|                             | 1911    | 1961    | 2011    |
|-----------------------------|---------|---------|---------|
| Total Population (millions) | 36.1    | 46.1    | 56.1    |
| <b>% people aged 15</b>     |         |         |         |
|                             | 1.86%   | 1.48%   | 1.23%   |
| Males                       | 334,200 | 349,400 | 354,400 |
| Females                     | 335,700 | 333,900 | 333,700 |
| <b>% people aged 75</b>     |         |         |         |
|                             | 0.23%   | 0.55%   | 0.70%   |
| Males                       | 34,100  | 160,200 | 181,300 |
| Females                     | 47,400  | 254,900 | 210,100 |

The table presents information about the total population of the UK, along with the percentages and numbers of males and females aged 15 and 75 in 1911, 1961 and 2011.

Overall, the UK population increased steadily over the period. Another clear trend is that the proportion of older people rose significantly, whereas the percentage of 15-year-olds declined. In most cases, females outnumbered males, particularly in the older age group.

In 1911, the total population was 36.1 million. People aged 15 accounted for 1.86%, with similar numbers of males (334,200) and females (335,700). By contrast, only 0.23% of the population were aged 75, and females (47,400) already exceeded males (34,100).

By 2011, the population had risen to 56.1 million. The proportion of 15-year-olds fell to 1.23%, although the number of males increased slightly to 354,400, while females decreased marginally to 333,700. Meanwhile, the percentage of those aged 75 grew to 0.70%. The number of males in this group increased sharply to 181,300. Female figures reached 254,900 in 1961 before falling to 210,100 in 2011, remaining far higher than in 1911.

6. The table below shows the number of motor vehicles per 1,000 inhabitants in eight countries in 1990 and 2000.

| The number of motor vehicles per 1,000 inhabitants |      |        |
|----------------------------------------------------|------|--------|
| Country                                            | 1990 | 2000   |
| Bahamas                                            | 235  | 187    |
| Brazil                                             | 55   | 13,580 |
| Cambodia                                           | 1    | 1      |
| Chile                                              | 68   | 88     |
| Jordan                                             | 50   | 157    |
| Luxembourg                                         | 548  | 728    |
| New Zealand                                        | 531  | 557    |
| Romania                                            | 68   | 8,102  |

The table compares the number of motor vehicles per 1,000 inhabitants in eight countries in 1990 and 2000.

Overall, vehicle ownership increased in most of the countries over the period, whereas the Bahamas was the only nation to experience a decline. Luxembourg and New Zealand had the highest figures in 1990, while Brazil and Romania recorded by far the most dramatic increases and became the leading countries in 2000. Cambodia remained unchanged at the lowest level throughout the period.

In 1990, Luxembourg had the highest vehicle ownership rate, with 548 vehicles per 1,000 inhabitants, closely followed by New Zealand at 531. The Bahamas ranked third with 235 vehicles. Over the following decade, the figures for Luxembourg and New Zealand rose modestly to 728 and 557 respectively. By contrast, the Bahamas saw a fall in vehicle ownership, declining from 235 to 187 vehicles per 1,000 people.

At the lower end of the scale, Cambodia recorded only one vehicle per 1,000 inhabitants in both years. In 1990, Brazil, Jordan, Romania and Chile all had relatively low figures, ranging from 50 to 68 vehicles per 1,000 people. However, by 2000, Brazil and Romania had experienced exceptionally large increases, reaching 13,580 and 8,102 respectively. Meanwhile, Jordan's figure more than tripled from 50 to 157, while Chile also recorded a moderate rise from 68 to 88 vehicles per 1,000 inhabitants.

**Word Count: 223**

**7. The chart below provides information about various academic and employment statistics for three Canadian universities.**

| University | % Lectures with PhD Qualification | % Lectures Given High Rate | % Students Complete Lessons | Employment Rate of Collegian |
|------------|-----------------------------------|----------------------------|-----------------------------|------------------------------|
| Brandon    | 30                                | 40                         | 80                          | 72                           |
| Seadford   | 50                                | 45                         | 70                          | 78                           |
| Harrison   | 42                                | 50                         | 78                          | 82                           |

The table compares three Canadian universities—Brandon, Seadford and Harrison—in terms of four indicators: the proportion of lecturers holding PhD qualifications, the percentage of highly rated lectures, student course completion rates and graduate employment rates.

Overall, Harrison performs best in most categories, leading in both lecture quality and graduate employment. By contrast, Brandon records the lowest figures in three of the four indicators, although it achieves the highest course completion rate. Seadford stands out for having the largest proportion of PhD-qualified lecturers.

Looking first at Brandon, only 30% of its lecturers hold PhD qualifications, the lowest figure among the three institutions. Likewise, just 40% of its lectures receive high ratings, compared with 45% in Seadford and 50% in Harrison. Brandon also records the weakest employment outcome, with 72% of graduates securing employment. However, it performs best in terms of course completion, with 80% of students successfully finishing their studies.

Seadford has the highest percentage of PhD-qualified lecturers, at 50%, but its performance in the remaining categories is less impressive. The proportion of highly rated lectures stands at 45%, while its graduate employment rate reaches 78%. In contrast, it records the lowest course completion rate, at 70%.

Harrison performs strongly across all measures. Half of its lectures are rated highly, the highest proportion shown in the table, and it also achieves the best graduate employment rate, at 82%. Furthermore, 42% of its lecturers possess PhD qualifications, while 78% of students complete their courses, placing the university second in both categories.

**Word Count: 235**

8. The table below shows the percentage of patients saying the service was very good.

The table below shows the percentage of patients saying the service was very good.

|            | Hospital Staff | Waiting Time | Treatment | Aftercare Service |
|------------|----------------|--------------|-----------|-------------------|
| Hospital A | 74% (2)        | 46% (3)      | 85% (1)   | 83% (1)           |
| Hospital B | 38% (3)        | 53% (2)      | 68% (3)   | 70% (3)           |
| Hospital C | 81% (1)        | 92% (1)      | 84% (2)   | 82% (2)           |

The table compares the percentages of patients who rated four aspects of service as “very good” in three hospitals: A, B and C.

Overall, Hospital C received the highest levels of patient satisfaction in two categories, namely hospital staff and waiting time, while Hospital A performed best in treatment and aftercare services. By contrast, Hospital B recorded the lowest ratings across all four aspects.

Looking first at Hospital C, it achieved the highest score for hospital staff, with 81% of patients expressing a very positive opinion. It also outperformed the other hospitals in terms of waiting time, with an exceptionally high figure of 92%, compared with just 53% for Hospital B and 46% for Hospital A. In addition, Hospital C received strong ratings for treatment and aftercare services, at 84% and 82% respectively, placing it second in both categories.

Hospital A showed the best results for treatment and aftercare. The proportions of patients rating these services as very good were 85% and 83% respectively, marginally higher than the corresponding figures for Hospital C. However, Hospital A ranked only second for hospital staff, at 74%, and recorded the lowest satisfaction level for waiting time, at 46%.

By comparison, Hospital B performed considerably less well than the other two hospitals. Only 38% of patients were highly satisfied with its staff, while 68% and 70% gave positive ratings to treatment and aftercare services respectively. Although its waiting-time score of 53% was higher than that of Hospital A, it remained far below Hospital C's figure.

**Word Count: 236**

9. The table below gives information about the situation of marriage and age from 1960 to 2000 in Australia.

| Year | Religion marriage | Civil marriage | The average age of bride | The average age of bridegroom |
|------|-------------------|----------------|--------------------------|-------------------------------|
| 1960 | 25.000            | 8.000          | 21                       | 24                            |
| 1970 | 28.000            | 12.000         | 23                       | 25                            |
| 1980 | 50.000            | 16.000         | 25                       | 27                            |
| 1990 | 32.000            | 23.000         | 27                       | 30                            |
| 2000 | 34.000            | 40.000         | 30                       | 32                            |

The table shows the number of marriages in Australia, divided into religious and civil types, along with the average age of brides and bridegrooms from 1960 to 2000.

Overall, civil marriages increased steadily and became more common by the end of the period, while religious marriages showed some fluctuation. In addition, the average age at marriage for both men and women rose gradually, and men were consistently older than women throughout the period.

In 1960, there were 25,000 religious marriages, compared to only 8,000 civil marriages. The number of religious ceremonies then increased significantly to reach a peak of 50,000 in 1980, which was the highest figure recorded. Meanwhile, civil marriages also rose during this time, doubling to 16,000, although they remained much less common than religious ones. After 1980, however, religious marriages declined to 32,000 in 1990 before rising slightly to 34,000 in 2000. By contrast, civil marriages continued to grow steadily, reaching 23,000 in 1990 and then 40,000 in 2000, when they became the more popular option.

Regarding age, brides were 21 years old on average in 1960, while bridegrooms were 24. These figures increased to 25 and 27 in 1980, and then to 30 and 32 in 2000. Overall, the age difference between men and women remained stable at around two to three years over the forty-year period.

**Word Count: 209**

10. The table below presents the food consumption per weekly in a European country in 1992, 2002 and 2012. (repeated)

1. The table below presents the food consumption per a person weekly in a European country in 1992, 2002 and 2012.

| Food       | 1992 | 2002 | 2012 |
|------------|------|------|------|
| Vegetables | 2140 | 2190 | 2220 |
| Meat       | 1148 | 1211 | 1132 |
| Wheat      | 837  | 920  | 977  |
| Bean       | 532  | 546  | 590  |
| Cheese     | 113  | 125  | 125  |

The table presents data on the weekly consumption of five types of food per person in a European country in 1992, 2002 and 2012, measured in grams.

Overall, vegetable consumption was consistently the highest and increased slightly over time, while meat intake showed a small decline. In addition, the consumption of wheat and beans rose steadily, whereas cheese remained relatively stable throughout the period.

In 1992, vegetables were by far the most consumed food at 2140 grams per person per week, which was significantly higher than all other categories. This figure increased gradually to 2190 grams in 2002 and then to 2220 grams in 2012. Similarly, wheat consumption rose steadily from 837 grams in 1992 to 920 grams in 2002, reaching 977 grams by 2012.

Bean consumption also experienced a moderate increase, climbing from 532 grams in 1992 to 546 grams in 2002 and eventually to 590 grams in 2012. By contrast, cheese consumption remained almost unchanged, rising slightly from 113 grams to 125 grams in 2002 and then staying constant in 2012. On the other hand, meat consumption, which stood at 1148 grams in 1992, increased marginally to 1211 grams in 2002 before declining to 1132 grams in 2012.

**11. The table below shows water use for different purposes in four countries.**

**The use of water by four different countries (%)**

| Country      | Domestic use | Industry | Agriculture |
|--------------|--------------|----------|-------------|
| Egypt        | 8            | 10       | 82          |
| Saudi Arabia | 6            | 30       | 64          |
| New Zealand  | 10           | 46       | 44          |
| Canada       | 20           | 70       | 10          |

The table compares the proportions of water used for domestic, industrial and agricultural purposes in four countries: Egypt, Saudi Arabia, New Zealand and Canada.

Overall, agriculture accounts for the largest share of water consumption in Egypt and Saudi Arabia, whereas industry is the dominant sector in New Zealand and Canada. In addition, domestic use represents the smallest proportion in most countries, with the exception of Canada, where agriculture is the least significant.

In Egypt, the vast majority of water is used for agriculture, at 82%, while only 10% is allocated to industry and an even smaller proportion, 8%, to domestic use. A similar pattern can be seen in Saudi Arabia, where agriculture makes up 64% of water consumption. However, this country uses a considerably higher percentage of water for industry, at 30%, compared to just 6% for households.

By contrast, water use in New Zealand and Canada is primarily driven by industry. In New Zealand, 46% of water is consumed by this sector, followed closely by agriculture at 44%, while domestic use accounts for just 10%. Canada shows an even more pronounced pattern, with 70% of water used for industrial purposes. Meanwhile, domestic consumption stands at 20%, and only 10% is used for agriculture, making it the smallest category.

Word count: 213

12. The two tables below show the exchange students from universities in Europe to Australia between 2007 and 2009.

Exchange students from universities in Europe to Australia

| Country        | 2007 | 2009 |
|----------------|------|------|
| France         | 61   | 60   |
| Sweden         | 34   | 42   |
| United Kingdom | 31   | 26   |
| Germany        | 27   | 62   |
| Netherlands    | 36   | 36   |
| Total          | 189  | 226  |

Exchange students from Australian Universities to universities in Europe

| Country        | 2007 | 2009 |
|----------------|------|------|
| France         | 37   | 58   |
| Sweden         | 33   | 27   |
| United Kingdom | 32   | 23   |
| Germany        | 18   | 26   |
| Netherlands    | 32   | 18   |
| Total          | 152  | 152  |

The two tables compare the number of exchange students between universities in Europe and Australia in 2007 and 2009.

Overall, more students travelled from Europe to Australia than in the opposite direction in both years. France was the most popular country for exchange students, while Germany experienced the most significant increase over the period. In contrast, the total number of Australian students studying in Europe remained unchanged.

Between 2007 and 2009, the total number of European students going to Australia rose from 189 to 226. France remained the leading source, with figures staying almost stable at around 60 students. Similarly, the Netherlands showed no change at 36 students. However, Germany saw a dramatic increase, more than doubling from 27 to 62, making it one of the largest contributors by 2009. Sweden also recorded moderate growth, rising from 34 to 42 students, whereas the United Kingdom experienced a slight decline from 31 to 26.

Regarding Australian students studying in Europe, the overall number stayed constant at 152 in both years. France and Germany became more popular destinations, increasing from 37 to 58 and from 18 to 26, respectively. By contrast, Sweden, the United Kingdom and the Netherlands all saw decreases, falling to 27, 23 and 18 students in 2009.

**13. The table below shows the percentage of the population and the types of houses they live in 3 areas of a city. (repeated)**

| Type of housing                             | Flat/ Apartment | Terraced | Semi-Detached | Detached |
|---------------------------------------------|-----------------|----------|---------------|----------|
| Central area -<br>(population<br>32,100)    | 15%             | 18%      | 28%           | 39%      |
| Green Park area -<br>(population<br>31,700) | 76%             | 14%      | 5%            | 5%       |
| Southberg Area -<br>(population<br>32,000)  | 25%             | 56%      | 5%            | 14%      |

The table compares the proportions of different types of housing in three areas of a city, namely the Central area, Green Park area and Southberg area, each with a population of approximately 32,000 people.

Overall, the three areas have similar population sizes, but there are significant differences in housing preferences. Detached and semi-detached houses are most common in the Central area, whereas flats dominate in Green Park. In contrast, terraced houses are the most popular type in Southberg.

In the Central area, detached houses account for the largest share at 39%, followed by semi-detached properties at 28%. Terraced houses and flats are less common, making up 18% and 15% respectively. By comparison, housing in Green Park is heavily dominated by flats and apartments, which represent 76% of all homes. The remaining housing types are far less common, with terraced houses accounting for 14%, and both semi-detached and detached houses making up just 5% each.

Southberg shows a different pattern, with terraced houses being the most prevalent type at 56%. Flats account for 25% of housing, while detached houses represent 14%. Semi-detached properties are the least common in this area, at only 5%.

Overall, each area exhibits a distinct housing pattern despite having similar population sizes.

**14. The table shows the production of milk annually in four countries in 1990, 2000 and 2010.**

| Nations     | Amount in litres |            |            |
|-------------|------------------|------------|------------|
|             | 1990             | 2000       | 2010       |
| Netherlands | 11,262,000       | 11,155,000 | 11,466,000 |
| Australia   | 11,246,000       | 11,105,000 | 9,165,000  |
| Tanzania    | 87,000           | 1,42,000   | 1,55,000   |
| Guatemala   | 26,000           | 55,000     | 84,000     |

The table presents data on the annual production of dairy products in four countries—namely the Netherlands, Australia, Tanzania and Guatemala—between 1990 and 2010, measured in litres.

Overall, the Netherlands consistently produced the largest amount of dairy across the period, while Australia was the only country to experience a significant decline. In contrast, both Tanzania and Guatemala saw steady increases in their production, although their figures remained far lower than those of the two developed countries.

In 1990, the Netherlands and Australia had similar levels of production, at approximately 11.26 million and 11.25 million litres respectively. Over the next decade, both countries experienced slight declines, with figures falling to 11.16 million in the Netherlands and 11.11 million in Australia. However, by 2010, the Netherlands recovered and reached a peak of 11.47 million litres, whereas Australia's output dropped sharply to 9.17 million litres.

By comparison, dairy production in Tanzania and Guatemala was minimal but showed consistent growth. Tanzania increased its output from 87,000 litres in 1990 to 142,000 in 2000, before rising further to 155,000 in 2010. Similarly, Guatemala's production more than tripled, climbing from 26,000 litres in 1990 to 84,000 litres by the end of the period.

Word count: **209**

15. The table shows the number of employees and factories producing silk in England and Wales between 1851 and 1901.  
(repeated)

| Year | Male   | Female | Total employees | Factories |
|------|--------|--------|-----------------|-----------|
| 1851 | 53.964 | 76.786 | 130.750         | 272       |
| 1861 | 41.936 | 67.933 | 109.869         | 761       |
| 1871 | 38.102 | 53.310 | 91.412          | 693       |
| 1881 | 25.766 | 32.138 | 67.904          | 702       |
| 1891 | 28.689 | 30.336 | 49.025          | 663       |
| 1901 | 13.375 | 25.567 | 38.942          | 623       |

The table provides information about the number of employees working in the silk industry and the number of silk factories in England and Wales between 1851 and 1901.

Overall, there was a significant decline in the total workforce over the 50-year period, while the number of factories showed some fluctuation but generally decreased towards the end. It is also noticeable that female workers consistently outnumbered male workers throughout the period.

In 1851, the total number of employees stood at 130,750, including 76,786 women and 53,964 men. Over the following decades, employment figures fell steadily. By 1871, the workforce had dropped to 91,412, and this downward trend continued until it reached a low of 38,942 in 1901. Both male and female employment declined, with male workers falling more sharply to just 13,375 by the end of the period, compared to 25,567 female workers.

In contrast, the number of factories initially rose from 272 in 1851 to a peak of 761 in 1861. After this sharp increase, the figure fluctuated, falling to 693 in 1871 and then slightly rising again to 702 in 1881. However, the number of factories gradually decreased in the following years, ending at 623 in 1901.

16. The tables show response to a questionnaire given by two groups of people (club members and the general public) who showed their opinions about a new theatre.

| Production Quality |           |              |      |
|--------------------|-----------|--------------|------|
|                    | Excellent | Satisfactory | Poor |
| Club members       | 70%       | 17%          | 13%  |
| General public     | 67%       | 18%          | 15%  |

| Information about the plays/performance to the public |           |              |      |
|-------------------------------------------------------|-----------|--------------|------|
|                                                       | Excellent | Satisfactory | Poor |
| Club members                                          | 72%       | 23%          | 5%   |
| General public                                        | 88%       | 10%          | 2%   |

| Facilities in the theatre |           |              |      |
|---------------------------|-----------|--------------|------|
|                           | Excellent | Satisfactory | Poor |
| Club members              | 75%       | 23%          | 2%   |
| General public            | 55%       | 19%          | 26%  |

The three tables present the results of a survey evaluating a new theatre, in which both club members and the general public rated production quality, information provision, and facilities as excellent, satisfactory, or poor.

Overall, the majority of respondents gave positive feedback across all three categories, with “excellent” being the most common rating. While both groups assessed production quality similarly, the general public showed greater satisfaction with the information provided, whereas club members rated the theatre’s facilities more highly.

In terms of production quality, the figures were almost identical for the two groups. Approximately 70% of club members rated it as excellent, compared to 67% of the general public. Meanwhile, poor ratings were relatively low and comparable, at 13% and 15% respectively.

A more noticeable difference can be seen in opinions on information about plays and performances. A substantial 88% of the general public rated this aspect as excellent, significantly higher than the 72% recorded among club members. Additionally, only 2% of the public gave a poor rating, compared to 5% of club members.

Regarding theatre facilities, club members were considerably more positive. Three-quarters of them (75%) rated the facilities as excellent, while only 2% were dissatisfied. In contrast, just 55% of the general public gave an excellent rating, and a much larger proportion, 26%, considered the facilities poor. **(Word count: 231)**

17. The table below shows the results of surveys of people in the UK, carried out in three different decades. It shows the percentages of people who said they were interested in certain sports. (repeated)

| Percentage of UK residents interested in named sports |      |      |      |
|-------------------------------------------------------|------|------|------|
| Sport                                                 | 1990 | 2000 | 2010 |
| Football                                              | 59   | 57   | 56   |
| Rugby                                                 | 12   | 20   | 24   |
| Golf                                                  | 28   | 28   | 26   |
| Cricket                                               | 12   | 12   | 14   |
| Judo                                                  | 9    | 5    | 4    |
| Swimming                                              | 15   | 18   | 16   |

The table presents the percentage of UK residents interested in six different sports in 1990, 2000, and 2010.

Overall, football consistently remained the most popular sport throughout the period, despite a slight decline. In contrast, rugby and cricket gained popularity over time, whereas interest in golf and judo decreased. Swimming showed minor fluctuations but remained relatively stable.

In 1990, football attracted the highest proportion of people at 59%, before gradually declining to 57% in 2000 and 56% in 2010. A similar but less pronounced downward trend can be observed in golf, which remained stable at 28% in 1990 and 2000, before falling slightly to 26% in the final year. Judo also experienced a steady decline, dropping from 9% to just 4% over the period, making it the least popular sport by 2010.

By contrast, rugby saw a significant increase in popularity, rising from 12% in 1990 to 20% in 2000 and reaching 24% in 2010. Cricket followed a more modest upward trend, remaining at 12% in the first two years before increasing to 14% in 2010. Meanwhile, swimming rose from 15% to 18% between 1990 and 2000, before experiencing a slight decrease to 16% at the end of the period.

18. The table shows the number of universities ranked top 200 in the world in three subjects in five countries.

Number of universities ranked top 200 in the world (2011)

| Country            | Subjects |          |            |
|--------------------|----------|----------|------------|
|                    | Biology  | Medicine | Psychology |
| The USA            | 69       | 54       | 58         |
| The United Kingdom | 30       | 24       | 29         |
| Australia          | 9        | 13       | 17         |
| New Zealand        | 6        | 2        | 4          |
| Canada             | 9        | 12       | 14         |

The table compares the number of universities in five countries that were ranked among the world's top 200 in 2011 across three academic disciplines: Biology, Medicine, and Psychology.

Overall, the United States overwhelmingly dominated all three subjects, while New Zealand had by far the fewest top-ranked institutions. The United Kingdom ranked a distant second, whereas Australia and Canada recorded relatively modest and comparable figures.

In detail, the United States had the highest number of top-200 universities in each discipline, with 69 in Biology, 54 in Medicine, and 58 in Psychology. These figures were more than double those of the United Kingdom, which had 30 universities for Biology, 24 for Medicine, and 29 for Psychology.

Among the remaining countries, Australia and Canada showed similar patterns, though Australia performed slightly better overall. Australia had 9 universities ranked in Biology, 13 in Medicine, and 17 in Psychology, compared to Canada's 9, 12, and 14 respectively. By contrast, New Zealand recorded the lowest figures across all three fields, with only 6 universities in Biology, 2 in Medicine, and 4 in Psychology.

In summary, while the US maintained a clear lead in all disciplines, the gap between the UK and the other countries remained substantial, and New Zealand consistently lagged behind. (Word count: 215)

---

19. The table below shows the proportion of the workforce who are women and the proportion of managers who are women in five different countries.  
(repeated)

| Country       | Women as % of workforce | Women as % of managers |
|---------------|-------------------------|------------------------|
| Australia     | 42                      | 43                     |
| Egypt         | 20                      | 12                     |
| Sri Lanka     | 41                      | 9                      |
| Japan         | 48                      | 17                     |
| United States | 46                      | 43                     |

The table compares the proportions of women in the workforce and in managerial positions across five countries.

Overall, Australia and the United States had the highest representation of women in both employment and management, with relatively small gaps between the two figures, whereas Egypt, Sri Lanka and Japan showed much larger disparities, indicating that women were underrepresented in leadership roles.

In Australia, women made up 42% of the workforce and a slightly higher 43% of managerial positions. A similar pattern can be observed in the United States, where women accounted for 46% of employees and 43% of managers, suggesting a fairly balanced distribution between general employment and leadership roles.

By contrast, the remaining countries displayed significant differences between the two categories. Japan had the highest proportion of women in the workforce at 48%, yet only 17% held managerial positions, revealing a considerable gap. Likewise, in Sri Lanka, although women represented 41% of the workforce, just 9% occupied management roles, the lowest figure in the table. Egypt followed the same trend, with women accounting for 20% of employees and only 12% of managers.

20. The table shows the amount of money given in aid of developing countries' technology by charities in the US, EU, and other countries from 2006 to 2010.

|                 | Billions of US dollars |      |      |      |      |
|-----------------|------------------------|------|------|------|------|
|                 | 2006                   | 2007 | 2008 | 2009 | 2010 |
| The US          | 9.7                    | 10.5 | 13.5 | 18   | 22.7 |
| EU countries    | 3.3                    | 3.4  | 3.8  | 3.7  | 4.0  |
| Other countries | 2.7                    | 2.9  | 3.1  | 2.6  | 3.3  |
| Total           | 15.7                   | 16.8 | 20.4 | 24.3 | 30   |

The table illustrates the total amount of donations made by the US, UK, and other countries to support technological developments in developing countries between 2006 and 2010.

We can notice from the table that the US was the most **significant contributor** to developing nations in all the above-mentioned years. At the same time, Europe and other countries donated a similar amount of money to help develop technology in **underdeveloped countries**.

Over five years, there was a **dramatic increase** in the total aid, which rose from USD 15.7 billion to USD 30 billion. In 2006, the USA donated over three times as much money as other countries to developing countries with a donation of USD 9.7 billion, while Europe and other countries contributed only \$3.3 and USD 2.7 billion, respectively.

Over the following two years, all the countries **steadily increased** their donations, wherein the total amount reached a total of USD 24.3 billion in the year 2009. The US charities **offered** the highest amount of donations with an **upsurge** in assistance, which **peaked** at USD 22.7 billion in 2010.

Meanwhile, the charities provided by Europe and other countries also increased gradually, **hiking** to \$3.8 and USD 3.1 billion in the year 2008 respectively. Despite a **vague** decrease in the aid provided by both countries in 2009, there was a **significant turnaround** in the assistance offered by Europe and other countries with a **contribution** of \$4.0 and USD 3.3 billion in 2010, respectively.
