

The charts give information about the average amount of time per day spent on two common leisure activities of different age groups in New Zealand.

The two bar charts illustrate the average daily time spent on reading for pleasure and listening to music across five age groups in New Zealand.

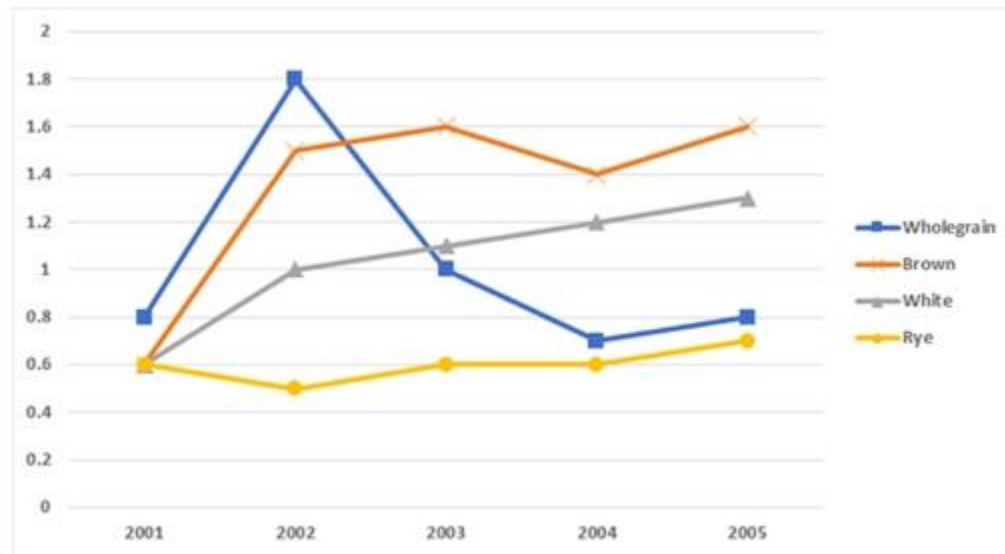

Overall, the amount of time spent reading increases steadily with age, whereas listening to music shows a fluctuating pattern. While younger individuals spend considerably more time listening to music, older people devote more time to reading and also show a renewed increase in music consumption.

In terms of reading, the youngest group (15–24) spends the least time, at approximately 20 minutes per day. This figure rises gradually across the age groups, reaching a peak of around 70 minutes among those aged 55 and over.

By contrast, listening to music is most popular among the 15–24 age group, at about 80 minutes daily. This is followed by a decline, with the lowest figure of roughly 45 minutes recorded among those aged 35–44. However, from the 45–54 group onwards, time spent on music increases again, peaking at approximately 75 minutes in the oldest group.

Line Graph

The chart below shows the price in Euros of 800 grams of four types of bread in one European country from 2001 to 2006.

The line graph illustrates the prices of four types of bread—wholegrain, brown, white, and rye—in a European country between 2001 and 2005.

Overall, the prices of brown, white, and rye bread increased over the period, whereas wholegrain bread fluctuated considerably before returning to its initial price. Brown bread recorded the most significant increase among the four types.

In 2001, brown, white, and rye bread were all priced at around €0.6. The price of brown bread rose sharply to €1.6 in 2003. Although it fell slightly to €1.4 in 2004, it recovered to €1.6 by 2005. Similarly, the price of white bread increased steadily throughout the period, reaching approximately €1.3 by 2005.

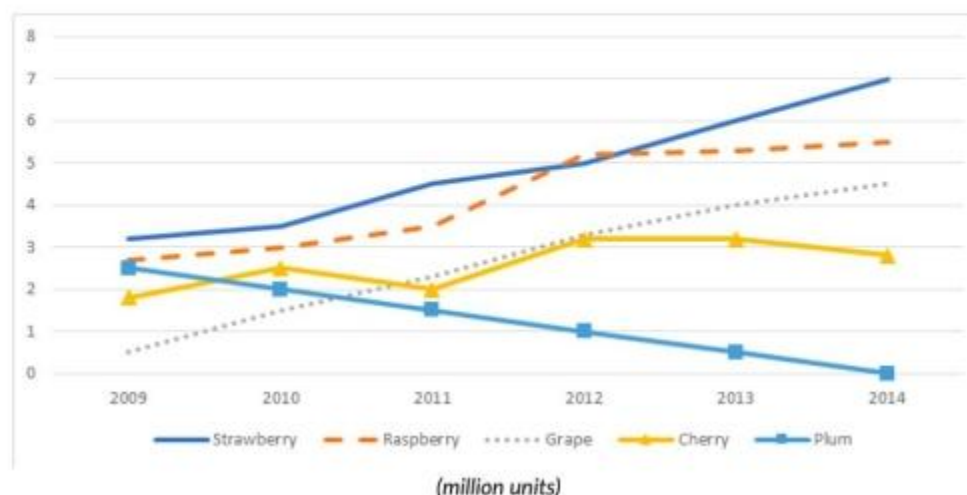

Rye bread remained stable at €0.6 until 2003, after which it rose modestly to about €0.7 by the end of the period.

Wholegrain bread was initially the most expensive at €0.8. Its price surged to €1.8 in 2002 before dropping sharply to €1.0 in 2003. The figure then continued to decline, eventually returning to €0.8 in 2005.

Line Graph

The charts shows the sales of five different kinds of jam from 2009 to 2014

The chart shows the sales of five different kinds of jam from 2009 to 2014

The line graph illustrates the sales of five types of jam between 2009 and 2014.

Overall, plum jam was the most popular at the beginning but experienced a dramatic decline over time. In contrast, strawberry, raspberry, and grape jams showed steady growth throughout the period, while cherry sales fluctuated.

Plum jam sales started at approximately 2,500,000 in 2009. However, this figure gradually decreased over the following years and eventually fell to zero by 2014.

In contrast, strawberry, raspberry, and grape jams followed similar upward trends. Grape jam sales began at around 500,000 in 2009 and increased significantly to about 4,600,000 in 2014. Similarly, strawberry and raspberry sales rose steadily during the period. Strawberry jam increased from roughly 3,100,000 to 7,000,000, while raspberry jam grew from approximately 2,800,000 to 5,400,000.

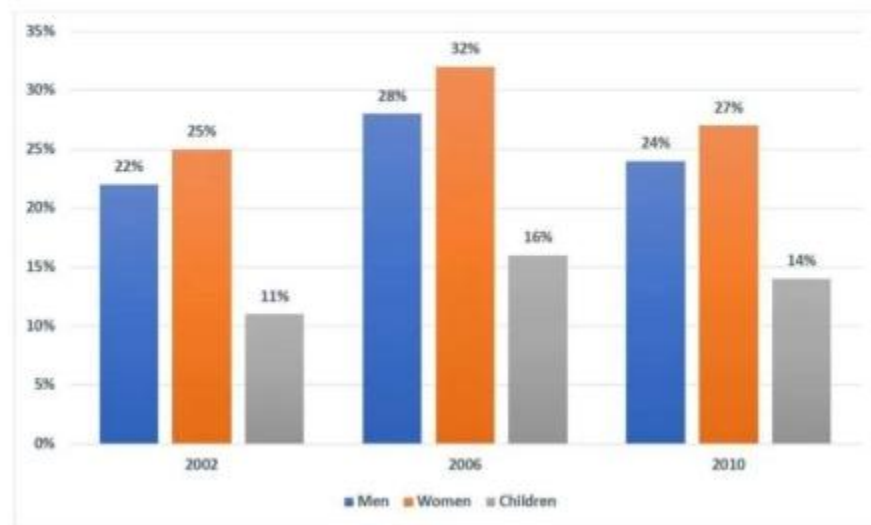

Cherry jam sales showed some fluctuations. They began at around 2,000,000 in 2009, remained stable until 2011, then increased sharply to about 3,000,000 in 2013 before slightly decreasing to 2,800,000 in 2014.

Bar Chart

The bar chart below shows the percentage of the population in the UK who consumed the recommended daily amount of fruit and vegetables in 2002, 2006 and 2010.

The chart below shows the percentage of the population in the UK who consumed the recommended daily amount of fruit and vegetables in 2002, 2006 and 2010.

The bar chart illustrates the percentage of men, women, and children in the UK who consumed the recommended daily intake of fruits and vegetables between 2002 and 2010.

Overall, the proportion of people in all three groups increased during the period. Women consistently recorded the highest percentages, whereas children had the lowest consumption levels throughout.

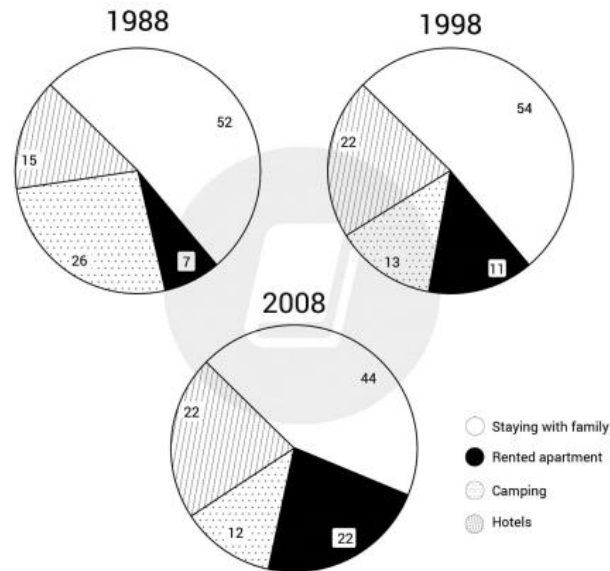

In 2002, around 25% of women consumed the recommended amount of fruits and vegetables. This was followed by approximately 22% of men, while the figure for children was about half of that level, at roughly 11%.

The proportions for all groups increased over the next few years. Women's consumption peaked at about 32% in 2006, while the figures for men and children rose to around 26% and 18%, respectively. However, by 2010 the percentages declined slightly, falling to approximately 27% for women, 24% for men, and 14% for children.

Word count: 154

Pie Chart

The charts below show the proportion of holidaymakers using four different types of accommodation in three different years.

The three pie charts illustrate the percentages of holidaymakers who chose four different types of accommodation in 1988, 1998, and 2008.

Overall, staying with family remained the most popular form of accommodation throughout the period, although its proportion decreased significantly by the end. In contrast, the percentages of tourists renting apartments and staying in hotels increased, while camping became less popular over time.

In 1988, more than half of holidaymakers stayed with family, accounting for 52%. This figure rose slightly to 54% in 1998 before dropping sharply by 2008. Meanwhile, the proportion of people choosing camping declined steadily from 26% in 1988 to just 12% in 2008.

By comparison, apartment rentals and hotel stays both showed upward trends. In 1988, 15% of holidaymakers rented apartments, and this figure increased to 22% by 1998, remaining stable thereafter. Similarly, the percentage of people staying in hotels rose steadily from 7% in 1988 to 22% in 2008, representing a threefold increase.

Word count: 178

Table

The table below shows the proportion of the workforce who are women and the percentage of managers who are women in five different countries.

Country	Women as % of workforce	Women as % of managers
Australia	42	43
Egypt	20	12
Sri Lanka	41	9
Japan	48	17
United States	46	43

The table compares the percentage of women in the workforce and in management roles across five countries: Australia, Egypt, Sri Lanka, Japan, and the United States.

Overall, the proportion of women in the workforce is relatively balanced across most countries except Egypt. However, the percentage of female managers is notably lower in Egypt, Sri Lanka, and Japan.

Among the five countries, the United States has high representation of women in both categories, with 46% of the workforce and 43% of managers being women, reflecting a **near-equal distribution**. Australia follows a **similar pattern**, with 42% of the workforce and 43% of managerial roles occupied by women, the only country where female representation in management slightly **surpasses** their share in the workforce.

In contrast, Sri Lanka and Japan **exhibit** the largest gender gaps in management. Meanwhile, Japan records the highest female workforce participation (48%), but their representation in management drops significantly to 17%. Similarly, although women **make up** 42% of the workforce in Sri Lanka, only 9% hold managerial roles. Displaying a smaller gap, Egypt has the lowest proportion of women in the workforce (20%) and only 12% in managerial roles.

Table

The table shows the number of employees and factories producing silk in England and Wales between 1851 and 1901.

Write at least 150 words.

Year	Male	Female	Total employees	Factories
1851	53.964	76.786	130.750	272
1861	41.936	67.933	109.869	761
1871	38.102	53.310	91.412	693
1881	25.766	32.138	67.904	702
1891	28.689	30.336	49.025	663
1901	13.375	25.567	38.942	623

The table shows changes in the average number of male and female workers as well as the number of silk factories over a 50-year period starting in 1851.

Overall, the total number of employees in the silk industry declined significantly during the period, while the number of factories fluctuated. In addition, women consistently made up the majority of the workforce.

In 1851, the silk workforce was at its highest level, with approximately 130,750 employees in total, including 53,964 males and about 77,000 females. Over the following 50 years, employment declined steadily. By 1901, the number of male workers had fallen nearly fourfold to about 13,375, while the number of female workers decreased threefold to around 26,000. Despite this decline, women remained the dominant group in the industry.

In contrast, the number of silk factories showed a fluctuating trend. Starting at 272 in 1851, the figure rose sharply to a peak of about 762 in 1861. After that, the number gradually declined to 623 by 1901.

Table

The table below gives information about populations in Australia and Malaysia in 1980 and 2002.

	Australia		Malaysia	
	1980	2002	1980	2002
Total population (in millions)	14.7	19.6	13.7	24.3
Male population (%)	49.9	49.9	50.3	50.6
Female population (%)	50.1	50.1	49.7	49.4
Birth rate (%)	1.5	1.3	3.2	2.2
Average annual population growth (%)	1.2	1.3	2.4	2.1
Population aged over 65 (%)	9.6	12.4	3.7	4.3

The table illustrates the population figures for Australia and Malaysia in 1980 and 2002, including gender distribution and average annual population growth.

Overall, the population increased in both countries during the period. Malaysia experienced faster population growth and had a larger total population by 2002, while the gender distribution in both countries remained almost equal.

In Australia, the total population rose from 14.7 million in 1980 to 19.6 million in 2002. Females accounted for 50.1% of the population in both years, while males made up the remaining 49.9%. The average annual population growth was relatively low, increasing slightly from 1.2% in 1980 to 1.3% in 2002.

In Malaysia, the total population grew more significantly, rising from 13.7 million in 1980 to 24.3 million in 2002. Males represented the majority of the population, accounting for 50.3% in 1980 and 50.6% in 2002, while females made up 49.7% and 49.4% respectively. Malaysia also recorded higher average annual population growth, at around 2.1% in 2002.

Table

The table shows percentage of UK visitors to Spain in 1981 and 2015.

The table shows percentage of UK visitors to Spain in 1981 and 2015.

Age	1981	2015
0-15	10%	12%
16-24	4%	15%
25-35	50%	32%
35-45	22%	12%
55+	16%	25%

The table shows the percentage of UK citizens in different age groups who visited Spain between 1981 and 2015.

Overall, the proportions of visitors aged 0–15, 16–24 and 55+ increased over the period, whereas the figures for those aged 25–35 and 36–45 declined. Despite this decrease, people aged 25–35 remained the largest group of visitors in both years.

In 1981, 50% of British visitors to Spain were aged 25–35, making it the dominant age group. However, this proportion fell significantly to 32% by 2015. Similarly, the percentage of visitors aged 36–45 decreased by about 10% during the same period.

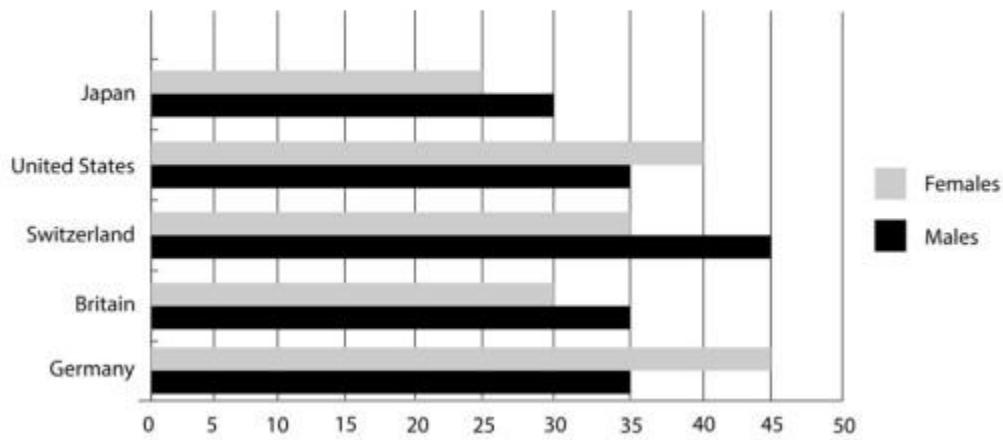

By contrast, younger and older age groups experienced increases. The proportion of visitors aged 0–15 rose slightly by around 2% between 1981 and 2015. The figure for the 16–24 age group increased more noticeably, from 4% in 1981 to 15% in 2015. Meanwhile, the proportion of visitors aged 55 and above grew significantly, reaching 25% by the end of the period.

Bar Chart

Band 7+: The Chart below shows the percentage of males and females with higher education qualifications in five countries in 2001.

The chart below shows the percentages of males and females with higher education qualifications in five countries in 2001.

The bar chart illustrates the percentages of males and females who entered higher education in Japan, the United States, Switzerland, Britain, and Germany in 2001.

Overall, Switzerland recorded the highest proportion of men entering higher education, while Germany had the highest percentage of women. In contrast, Japan had the lowest participation rates for both genders, particularly among females.

Among males, Switzerland had the highest percentage at 45%. The United States, Britain, and Germany followed with similar figures of around 35%, while Japan had the lowest proportion of male participants at 30%.

Regarding females, Germany recorded the highest figure at 45%. The United States also had a relatively high percentage of women entering higher education, at 40%. Switzerland and Britain reported moderate levels at 35% and 30%, respectively, whereas Japan had the lowest proportion at just 25%.

Word count: **158**

Table

The table below presents the food consumption per a person weekly in European country in 1992, 2002 and 2012.

Food	1992	2002	2012
Vegetables (grams)	2140	2190	2220
Meat	1148	1211	1132
Wheat	837	920	977
Bean	532	546	590
Cheese	113	125	125

The table compares the weekly amount of five types of food consumed per person in a European country in 1992, 2002, and 2012.

Overall, vegetables were consistently the most consumed food throughout the period, while cheese remained the least popular. Most food categories experienced slight increases, although meat consumption declined slightly by the end of the period.

In 1992, vegetable consumption stood at 2,140 grams per person per week and rose modestly to about 2,220 grams in 2012. In contrast, meat consumption increased from 1,148 grams in 1992 to 1,211 grams in 2002 before falling slightly to 1,132 grams by 2012.

Wheat consumption also showed a gradual rise, increasing from 837 grams in 1992 to a peak of 977 grams in 2012. A similar but smaller increase was seen in bean consumption, which grew from 532 grams to 590 grams during the same period. Cheese consumption rose from 113 grams in 1992 to 125 grams in 2002 and then remained stable until 2012.

Pie Chart

The chart below shows the types of language train of employs in one Export Company and the reasons why they learn a foreign language.

The two pie charts show the different types of language training chosen by employees in an export company and the reasons why they decided to learn a second language.

Overall, part-time evening classes were the most popular type of training, while distance learning was the least common. In terms of reasons for learning another language, holiday travel was the main motivation for most employees.

Looking at the types of training, the largest proportion of workers chose evening classes, accounting for 38%. Training during working hours and self-study were also common, at 23% and 22% respectively. Intensive training was chosen by 12% of employees, while only 5% preferred distance learning.

Regarding the reasons for studying another language, holiday travel was the most important factor, representing 45%. Business travel accounted for 18%, followed by personal interest at 14%. The percentages for meeting new people and communicating with overseas customers were relatively similar, at 13% and 10% respectively.

Bar Chart

The charts below show the number of working hours per week, in industrial sector, in four European countries in 2002

Summarize the information by selecting and reporting the main features and make comparisons with relevant.

Write at least 150 words.

The charts compare the average weekly working hours of employees in four European countries.

Overall, the majority of workers in Sweden, Denmark, and France work between 31 and 40 hours per week, whereas the UK has a relatively larger proportion of employees working long hours. France is the only country where the 31–35 hour range represents the most common working schedule.

In the UK, the proportion of employees working 50 hours or more per week is the highest among the four countries, while Sweden has the smallest share in this category. Sweden also shows the greatest concentration of workers in a single range, with about 80% working between 36 and 40 hours per week. Denmark follows a similar pattern, with roughly 70% of workers in its most common category.

In both Sweden and Denmark, the proportion of workers increases gradually up to the 36–40 hour range before declining. By contrast, France and the UK display a different distribution, with a noticeable percentage of employees working more than 45 hours per week, a pattern that is not seen in Sweden or Denmark.

The graph below gives information about the price of bananas in four countries between 1984 and 2004.

The graph below gives information about the price of bananas in four countries between 1994 and 2004.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

Write at least 150 words.

The line graph illustrates the price of bananas per kilogram in Japan, France, Germany, and the USA between 1996 and 2004.

Overall, banana prices fluctuated considerably in Japan and France, while Germany showed a gradual increase and the USA remained relatively stable. Among the four countries, Japan experienced the most noticeable changes.

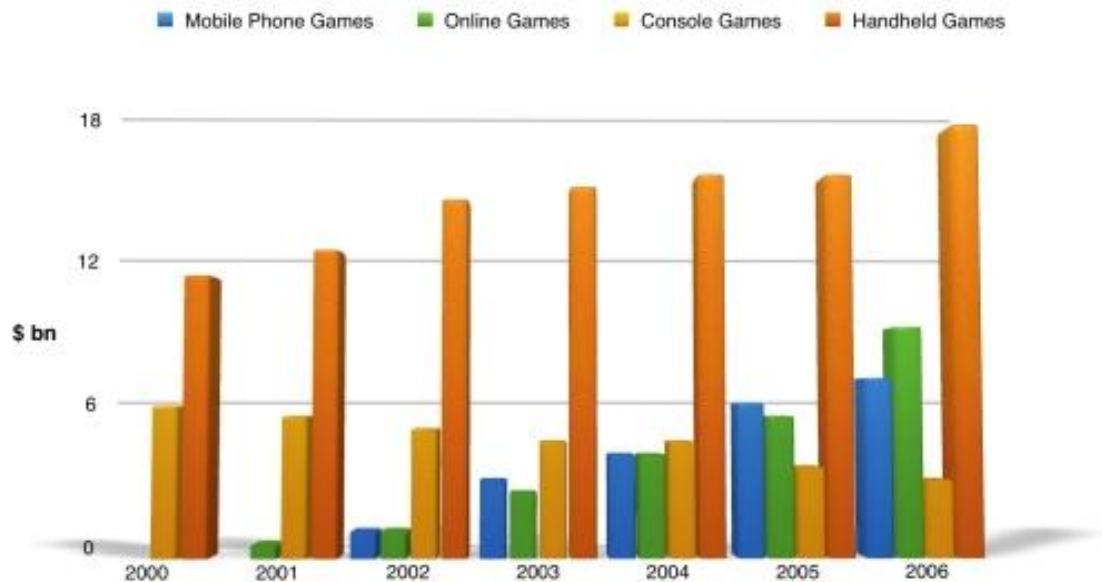

In 1996, the price of bananas in both Japan and France was \$2 per kilogram. In Japan, prices rose to a peak of \$3 in 1998 before dropping sharply to about \$1.5, and then recovering to approximately \$2.5 by 2004. In contrast, prices in France remained stable during the first few years before falling to around \$1.5 and then gradually returning to \$2 by the end of the period.

In Germany, the price started at about \$1.5 in 1996, declined slightly to around \$1.3 in 1997, and then increased steadily to \$1.8 by 2002, remaining at this level afterwards. Meanwhile, banana prices in the USA rose slightly from about \$1 in 1996 to around \$1.3 in 1998 and then stayed relatively stable at about \$1.2 for the rest of the period.

Bar Chart

The chart below shows the global sales of different kinds of digital games from 2000 to 2006.

The bar chart shows global sales revenue for four types of digital games between 2000 and 2006.

Overall, handheld games generated the highest sales throughout the period, while console games experienced a steady decline. In contrast, online games and mobile phone games showed significant growth over the years.

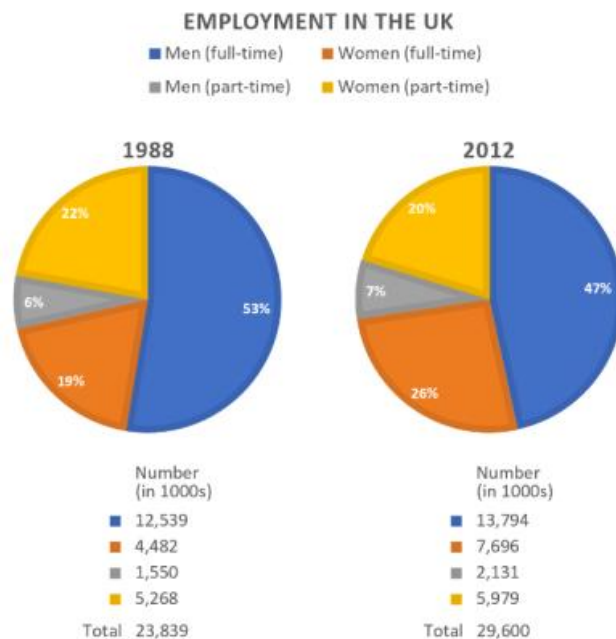

Handheld games consistently dominated the market, with sales increasing from about \$11 billion in 2000 to approximately \$17 billion in 2006. Console games were the second most popular at the beginning of the period, with sales of around \$6 billion in 2000, but their revenue gradually declined to just under \$6 billion by 2006.

By contrast, online and mobile phone games emerged later but grew rapidly. Online game sales rose from about \$1 billion in 2001 to roughly \$4 billion in 2006. Similarly, mobile phone games appeared around 2002 and increased steadily, reaching over \$6 billion by 2006. In 2004, both categories recorded similar sales of approximately \$5 billion.

Pie Chart

The chart below shows the percentage of people working in the UK in 1988 and 2012. Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

The charts illustrate the number of employed people in the UK across four employment categories in 1988 and 2012.

Overall, the proportions of workers in the four categories remained relatively similar in both years. However, the total number of employed people increased significantly in 2012 compared with 1988.

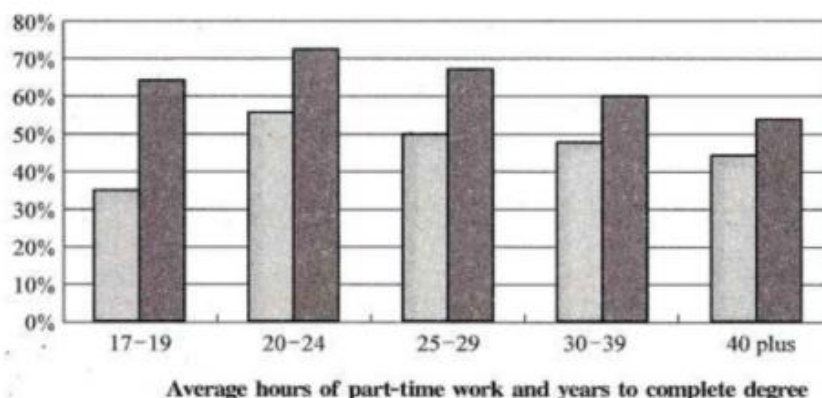

In 1988, full-time male workers represented the largest group, with around 13,000 employees, while part-time female workers accounted for approximately 5,500. By 2012, these categories experienced modest increases, rising by about 6% and 2% respectively.

More noticeable changes were observed in the remaining categories. The number of women working full time almost doubled, increasing from roughly 4,500 in 1988 to around 7,700 in 2012. In contrast, the number of men working part time grew only slightly, rising by about 1% over the same period.

Word count: **156**

Multiple Graphs

The bar chart below shows the percentage of students with part-time jobs in Australia in 1983 and 2003, and the table shows the average hours of part-time work and years to complete degree.

	1983	2003
Average paid work per week	5 hours	14.4 hours
Average years to complete degree	3 years	4 years

The bar chart shows the percentage of Australian students in different age groups who had part-time jobs in 1983 and 2003. The table presents the average weekly working hours and the number of years required to complete a degree in these years.

Overall, the proportion of students with part-time jobs increased in all age groups between 1983 and 2003. In addition, both the average working hours per week and the number of years needed to complete a degree rose during the period.

In terms of age groups, students aged 17–19 had the highest percentage of part-time employment. Their proportion almost doubled, reaching just over 60% in 2003. The percentages for the 20–24 and 25–29 age groups also increased significantly, both reaching around 70% by 2003. Meanwhile, the figures for students aged 30–39 and those aged 40 and above rose more moderately, reaching approximately 60% and 55% respectively.

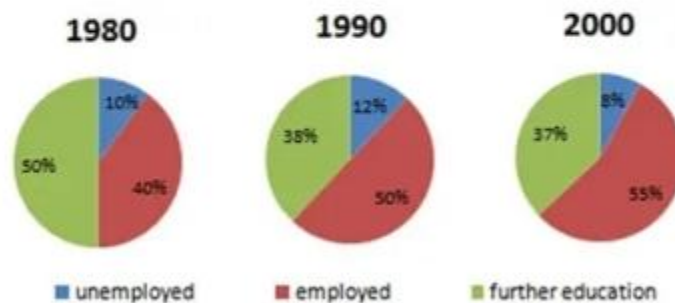

Regarding working hours, students worked an average of 5 hours per week in 1983, which increased threefold over time. The average number of years required to complete a degree also rose slightly, from 3 years in 1983 to 4 years in 2003.

Word count: 179

Pie Chart

The charts show the Australian school leavers did immediately after leaving secondary school.

The charts show the Australian school leavers did immediately after leaving secondary school.

The pie charts show the proportions of Australian school leavers who chose different options after finishing secondary school in 1980, 1990, and 2000.

Overall, employment became the most common choice over time, while the proportion of students continuing to further education declined. Meanwhile, unemployment remained the least common outcome throughout the period.

In 1980, further education was the most popular option, accounting for 50% of school leavers. However, this proportion fell steadily to 38% in 1990 and slightly further to 37% in 2000.

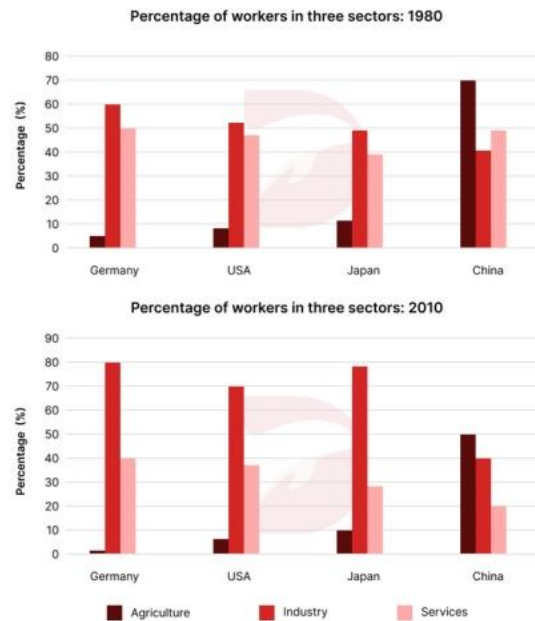

By contrast, the percentage of students entering employment increased significantly. Around 40% of school leavers found jobs in 1980, and this figure rose to 50% in 1990. By 2000, the proportion had increased further to 55%, making it the dominant choice.

The proportion of unemployed students remained relatively low throughout the period, fluctuating between approximately 8% and 12%.

Word count: 162

Bar Chart

The charts below show the percentage of workers in three sectors across four countries in 1980 and 2010.

The bar charts compare the proportions of workers employed in agriculture, industry, and services in Germany, the USA, Japan, and China in 1980 and 2010.

Overall, industry was the dominant employment sector in Germany, the USA, and Japan in both years, whereas China had a much larger share of workers in agriculture in 1980. Over time, agricultural employment declined in all four countries, while the services sector generally expanded.

In Germany, industry remained the largest sector, while the proportion of workers in services fell slightly from about 50% in 1980 to around 40% in 2010. Agriculture accounted for only a small percentage of employment in both years.

A similar pattern was observed in the USA and Japan, where the share of agricultural workers declined while employment in services increased, particularly in Japan.

China experienced the most dramatic change. In 1980, the majority of workers were employed in agriculture, but this proportion dropped sharply by 2010, while the services sector grew significantly. The percentage of workers in industry remained relatively stable during the period.

Word count: **178**

The table shows the amount of money given to developing countries by the USA, EU countries, and other countries from 2006 to 2010 (Figures are in millions of dollars).

	2006	2007	2008	2009	2010
USA	9,8	11	17	16,7	20,3
EU	3,1	3,4	3,9	3,6	4,1
Other countries	2,8	3,2	3,5	3,2	3,7
Total	15,7	17,6	24,4	23,5	28,1

The chart illustrates the amount of money donated to developing nations by America, Europe, and other countries between 2006 and 2010.

Overall, America contributed the largest amount of donations throughout the period, while Europe donated considerably less. Contributions from other countries were the lowest overall.

In 2006, the United States donated approximately 9.8 million dollars. This figure increased steadily to around 17 million in 2008. However, donations fell slightly to about 16.7 million in 2009 before reaching a peak of approximately 20.3 million in 2010.

Europe donated significantly smaller amounts. Its contribution rose gradually from 3.1 million in 2006 to about 4.1 million by 2010.

Meanwhile, donations from other countries remained the lowest during the period, with a combined total of about 16.4 million dollars between 2006 and 2010.

Word count: **156**

Table

The graph below shows the average retirement age of males and females in six countries in 2003.

Retirement age of males and females in six countries, 2003

Cities	Men		Women	
	Years	Months	Years	Months
Australia	64	1	63	5
United States	65	6	64	2
Japan	67	4	66	9
Italy	67	4	66	9
France	57	4	56	9
Korea	68	8	67	2

The table compares the ages at which males and females in six different countries decided to retire in 2003.

Overall, what is notable from the chart is that Korea exhibited the highest retirement ages for both genders while France had the lowest. In addition, across all countries, males tended to work longer than females before retiring.

Regarding countries with the highest retirement age, Korea led the chart, with men retiring at 68 years and 8 months, approximately 1 and a half year later than females. Japan and Italy shared a similar trend, as the retirement age of males stood at 67 years and 4 months, exceeding that of females by 7 months.

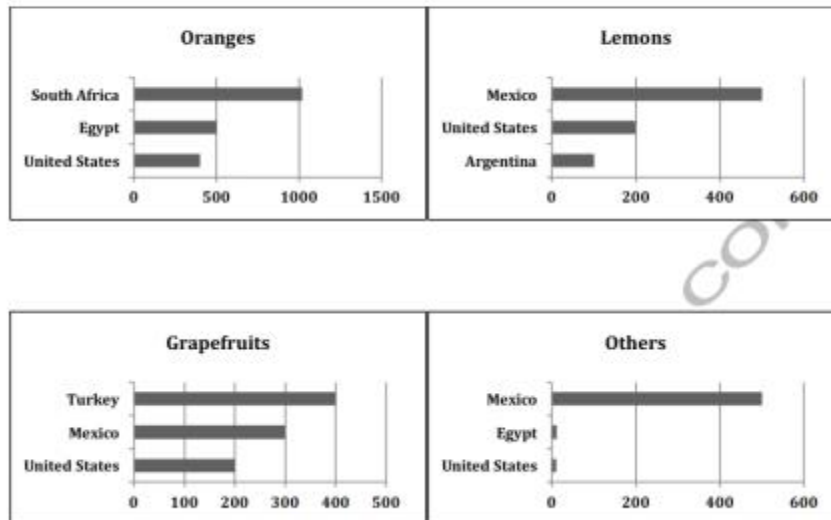

Concerning Australia and the United States, the figures differed slightly, varying from 63 years to 65.5 years. Finally, French men usually retired at the age of 57 years and 4 months whereas their female counterparts did so at 56 years and 9 months.

Multiple Graphs

Band 7+: The graphs below show four categories of citrus fruits and the top three countries to which these were exported (in thousand tonnes) in 2012.

12. The graphs below show four categories of citrus fruits and the top three countries to which these were exported (in thousand tonnes) in 2012. Summarise the information by selecting and reporting the main features and make comparisons where relevant.

The bar charts illustrate the exports of four categories of citrus fruits – oranges, lemons, grapefruits, and other fruits – from the top three exporting countries in 2012.

Overall, oranges were the most widely exported citrus fruit, with South Africa leading, while Turkey was the largest exporter of grapefruits. Mexico dominated exports of lemons and other citrus fruits.

In 2012, South Africa exported just over 5 million tonnes of oranges, followed by Egypt at around 4 million tonnes and the United States at approximately 1 million tonnes. For grapefruits, Turkey led with 4 million tonnes, followed by Mexico at 3 million tonnes and the United States at 2 million tonnes.

Regarding lemons and other fruits, Mexico exported about 5 million tonnes of each, ranking first in both categories. The United States exported 2 million tonnes of lemons and 1 million tonnes of other fruits, while Egypt exported around 0.5 million tonnes of other fruits.

Table

The table below gives information about the population of people aged 60 and over in six regions in 2000 and the predicted figures for 2050. It also shows the world total of people aged 60 and over in 2000 and 2050.

Region	2000	2050
Africa	5%	12%
North America	11%	26%
Europe	22%	31%
Asia	12%	28%
Latin America	7%	18%
Oceania	11%	22%
Whole world	13%	24%

The table shows the proportion of the population aged 60 and above in six regions in 2000 and 2050, along with the world total.

Overall, the percentage of older people is projected to rise in all regions by 2050. Europe had the highest proportion in 2000 and will remain the oldest region, while Africa will continue to have the lowest.

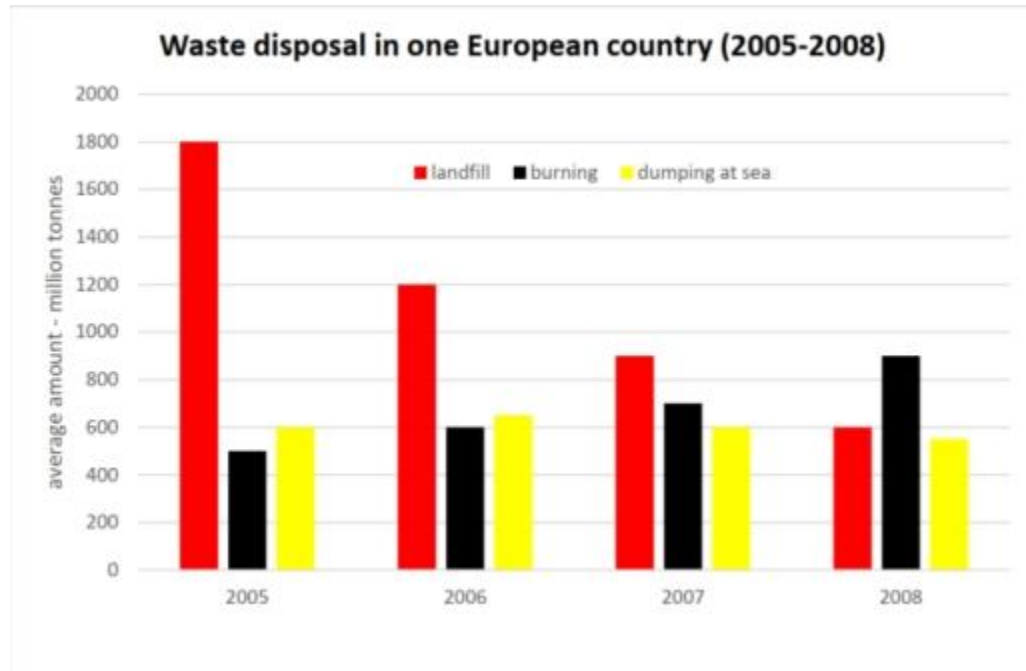

In 2000, Europe accounted for 22% of the population aged 60+, increasing to 31% by 2050. North America and Asia are also expected to grow substantially, from 11% to 26% and from 12% to 28%, respectively, both above the projected world average of 24%.

Other regions are expected to see considerable increases as well. Oceania's share will double from 11% to 22%, while Latin America will rise from 7% to 18%. Although Africa's proportion will increase from 5% to 12%, it will remain the youngest region in 2050.

Bar Chart

The chart below shows the waste disposal in one European Country in four years 2005, 2006, 2007, and 2008.

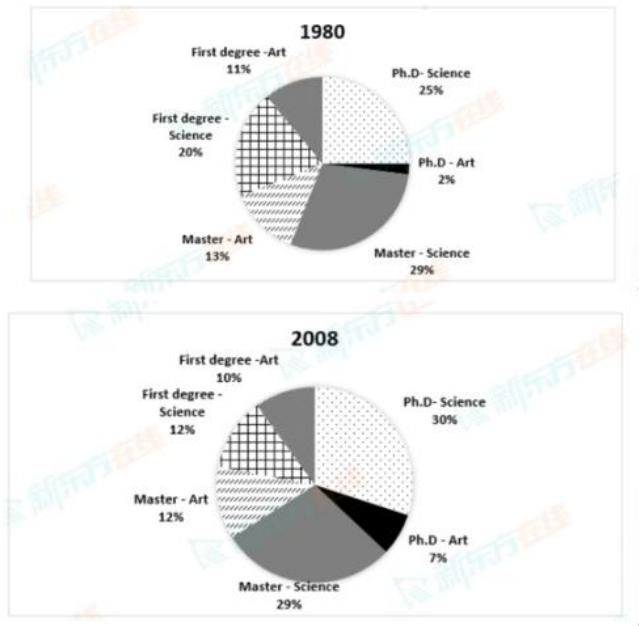

The bar chart illustrates the quantities of waste disposed of by landfill, burning, and dumping at sea between 2005 and 2008.

Overall, waste sent to landfills declined sharply, while the quantities for burning and dumping at sea remained relatively stable. Burning showed a slight increase, and dumping at sea stayed close to its previous levels.

Landfill waste decreased dramatically from approximately 1.8 billion tonnes in 2005 to around 0.6 billion tonnes in 2008, nearly a two-thirds reduction. Dumping at sea remained fairly constant at about 0.6 billion tonnes from 2005 to 2007, with a slight decline by 2008. In contrast, burning increased gradually from roughly 0.5 billion tonnes in 2005 to 0.9 billion tonnes in 2008. Neither burning nor dumping exceeded 1 billion tonnes or fell below 0.4 billion tonnes during this period.

Word count: 157 ✓

The charts below show the proportion of graduates with different qualifications working in one engineering company in 1980 and 2008.

The pie charts illustrate the proportions of graduates with various qualifications working in an engineering company in 1980 and 2008.

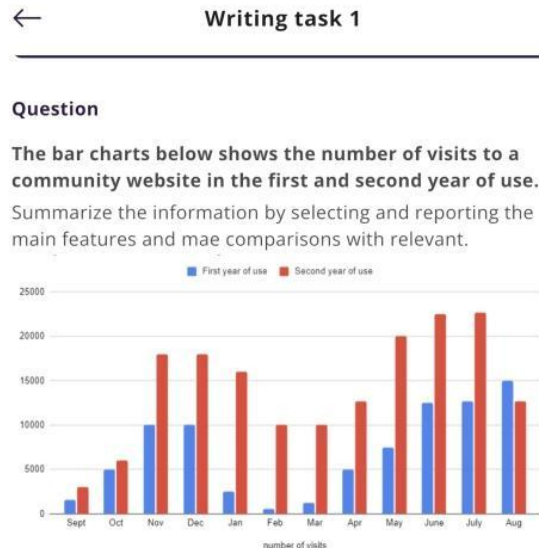

Overall, first degrees in art and science and master's in art decreased over the period, while PhDs in science and art increased. Master's degrees in science remained the largest proportion throughout.

In 1980, 29% of PhD graduates held a science degree, the highest share on the chart, and this figure remained unchanged in 2008. By contrast, the proportion of first-degree science graduates fell from 20% in 1980 to 12% in 2008, while PhD science increased slightly from 25% to 30%.

Art degrees represented smaller shares. PhD art increased from 2% to 7%, remaining the lowest proportion, while first-degree art and master's in art both declined slightly by 1–2% over the period.

Word count: 157 ✓

The bar charts below shows the number of visits to a community website in the first and second year of use.

The bar chart illustrates the number of visits to a community website in the first and second years after its launch.

Overall, the website attracted more visitors in the second year than in the first in nearly every month, with August being the only exception.

In the first year, the site had fewer than 1,000 users in September, but visits increased rapidly, reaching 10,000 by November. After a sharp decline in December and January, the number of visitors rose steadily, peaking at 15,000 in August.

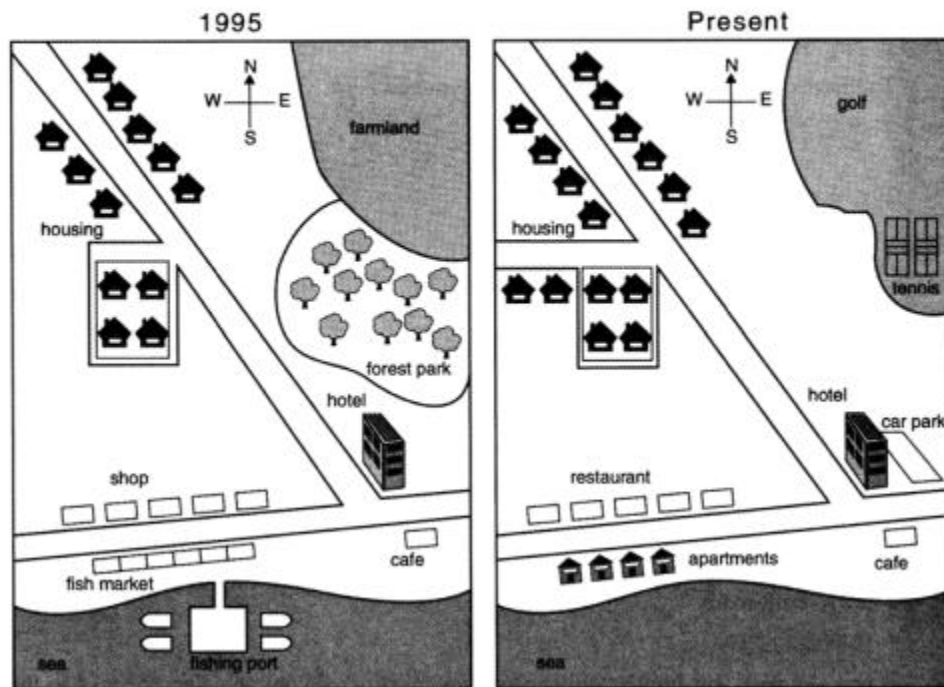

Similarly, the second year began with around 2,500 users. Visits increased steadily, reaching just under 20,000 in November, before declining slightly in January and February. Subsequently, the total number of users continued to rise, peaking at over 20,000 in July, then falling to approximately 12,500 by August.

Map

The maps show the changes of a small village from 1995 to present.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant. Write at least 150 words.

The maps illustrate changes in a small village from 1995 to the present, highlighting differences in layout and facilities.

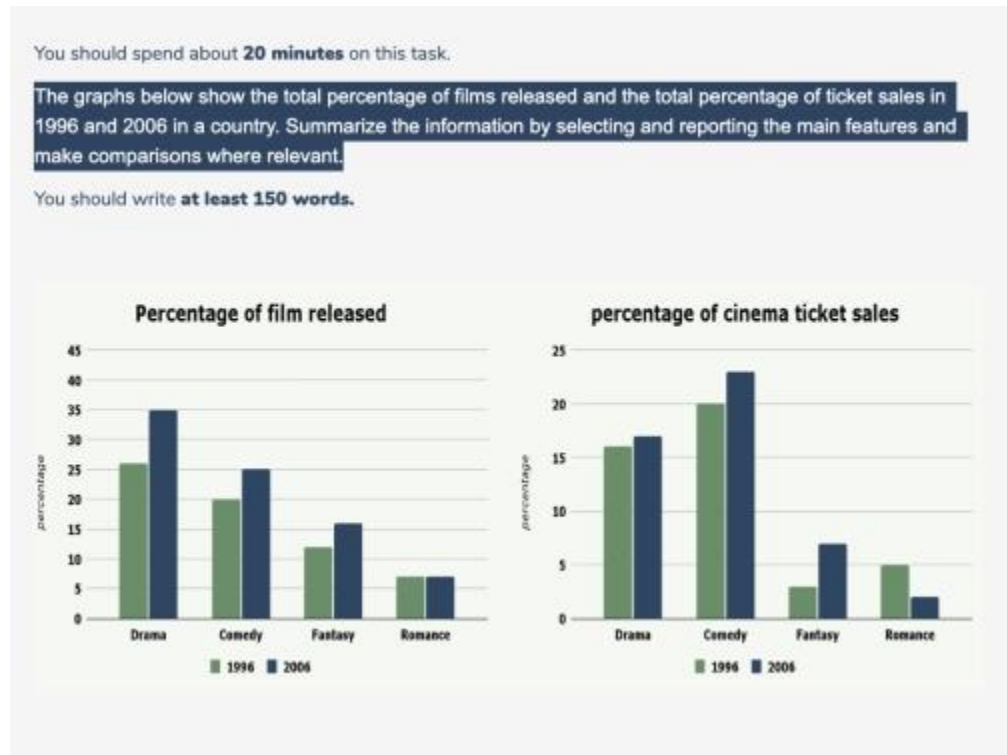

Overall, the village has undergone significant transformations, with some areas replaced and new amenities added. These changes indicate a shift from farming and commercial uses toward residential and recreational spaces.

In 1995, the northwest comprised twelve houses, while the northeast was mainly farmland. The eastern area featured a forest park, and a hotel was situated in the southwest. A shop stood west of the hotel, with a fish market near the southern coast by the fishing port, and a small café occupied the southeastern corner.

Today, the farmland has been replaced by a golf course, accompanied by a tennis area to the southwest. The shop has become a restaurant, and new apartments have been built south of it, increasing housing. A car park has been added east of the hotel and north of the café, likely to accommodate more visitors.

Word count: 165 ✓

The graphs below show the total percentage of films released and the total percentage of ticket sales in 1996 and 2006 in a country.

The chart illustrates the proportion of films released and cinema ticket sales for four genres—Drama, Comedy, Fantasy, and Romance—between 1996 and 2006.

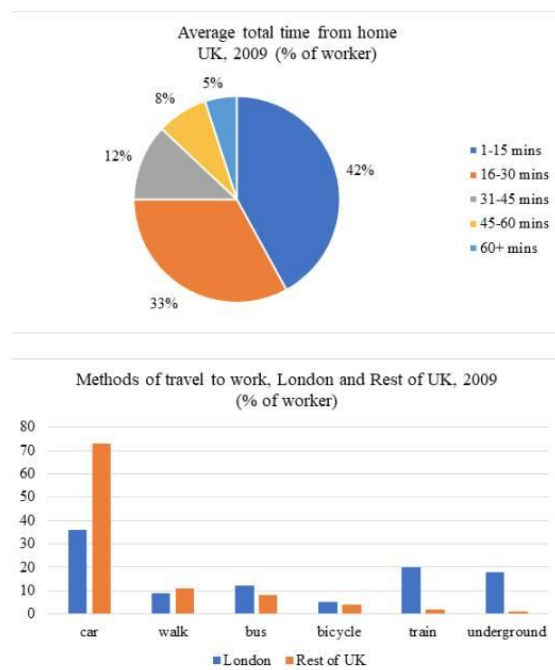

Overall, Drama was the most frequently released genre, while Comedies consistently attracted the highest proportion of ticket sales. Romance had the smallest share of both releases and sales throughout the period.

In 1996, Drama accounted for 26% of film releases, followed by Comedy at 20%, Fantasy at 12%, and Romance at 6%. By 2006, Drama rose to 35%, Fantasy to 13%, while Comedy remained at 20%. Releases of Romance stayed relatively stable before declining slightly.

Regarding ticket sales, Comedies led with 20% in 1996, followed by Drama at 16%, Romance at 5%, and Fantasy at 3%. By 2006, Comedy increased to 23%, Drama to 17%, and Fantasy to 7%, whereas ticket sales for Romance fell sharply to 3%.

Word count: 155 ✓

The charts below show the average time UK workers spent traveling to work and their methods of transportation in 2009.

The given pie chart depicts the average commuting time for UK laborers in 2009, while the line graph illustrates six means of transportation used to reach work in the same year.

Overall, a significant percentage of workers (42%) took 15 minutes or less to commute. In addition, automobiles were the most popular mode of transport, while bicycles were the least popular in London, and the underground was less favored by workers in other areas of the UK.

As can be seen from the pie chart, 42% of UK workers commuted for 15 minutes or less, while only a minority spent more than 1 hour commuting. Besides, commuting time of 16 minutes to half an hour was typical for one-third of workers, which is three times and four times longer than the proportion of those who traveled for 31-45 minutes and 45-60 minutes, respectively.

What stands out from the line graph is that approximately 40% of London laborers and three-quarters of workers in the rest of the UK drove cars to their workplaces, making it the most used method of transportation. Conversely, bicycles were the least popular in London (5%), while the underground was least favored in other areas (1%). In addition to automobiles, London workers favored trains and the underground (about 20%), whereas laborers in other regions preferred walking or taking buses (around 10%).

Bar Chart

The chart below shows the percentage of different types of household waste that were recycled in one city between 1992 and 2002. Summarize the information by selecting and reporting the main features, and make comparisons where relevant.

The chart below shows the percentage of different types of household waste that were recycled in one city between 1992 and 2002.

Summarize the information by selecting and reporting the main features, and make comparisons where relevant.

The bar chart illustrates the proportions of four types of recycled domestic waste—plastic, cans, paper, and glass—between 1992 and 2002.

Overall, recycling increased in all categories, with glass showing the most significant growth. Plastic consistently had the lowest recycling rate, while glass ended the period as the most recycled material.

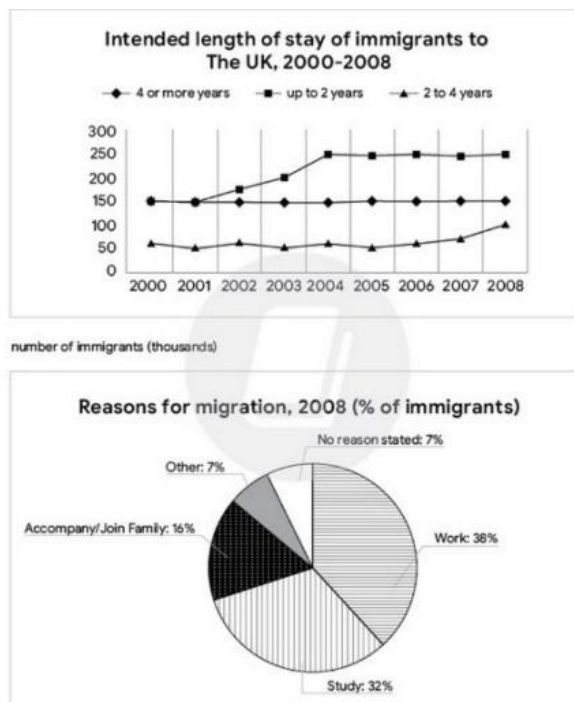

In 1992, cans accounted for about 20% of total recycled waste, compared with 10% for plastic. The proportion of cans dropped slightly to 13% by 1997, before rising again to around 23% by 2002. Plastic recycling increased only slightly from 10% to 12% by 1997 and then remained stable.

Paper and glass showed stronger growth. Paper doubled from 15% in 1992 to over 30% in 1997, continuing to nearly 40% by 2002. Glass increased from 15% to 28% in 1997, and then soared to just under 50% by 2002, the highest figure among all categories.

Word count: 164 ✓

Multiple Graphs

The graph and chart below give information about migration to the UK. The graph below shows how long immigrants in the year 2000-2008 intended to stay in the UK. And the pie-chart shows reasons for migration in 2008.

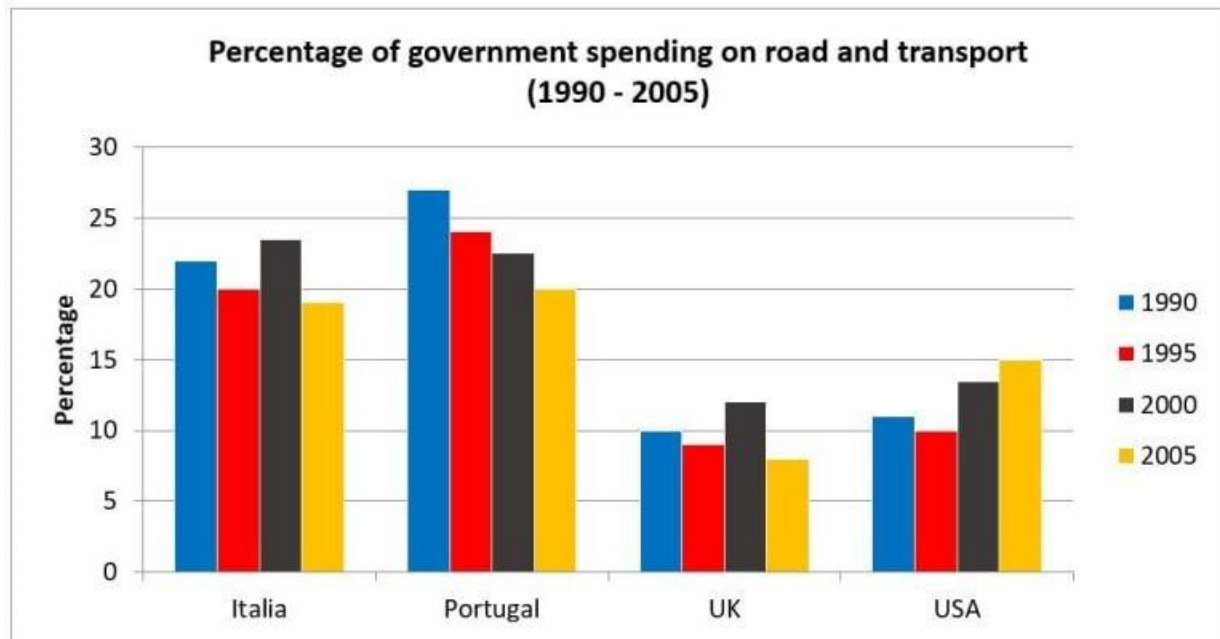

The charts illustrate the intended length of stay of immigrants in the UK between 2000 and 2008 and the main reasons for migration in 2008.

Overall, the number of immigrants planning to stay for up to two years increased significantly and became the largest group by 2008. In contrast, those intending to stay for two to four years consistently represented the smallest category. In terms of reasons for migration, employment was the dominant factor.

In 2000, the number of immigrants intending to stay for up to two years and those planning to remain for four or more years were equal, at approximately 150,000 each. Meanwhile, only around 50,000 immigrants planned to stay for two to four years. By 2002, the figure for short-term immigrants had risen to about 200,000 and continued to increase sharply to 300,000 by 2008. In comparison, the number of long-term immigrants remained relatively stable at roughly 150,000 throughout the period, while the two-to-four-year group gradually increased to around 100,000.

According to the pie chart, work accounted for the largest share of migration in 2008 (38%), followed by study (32%), family reasons (16%), and other or unspecified causes (7%).

The bar chart below shows the percentage of government spending on roads and transport in 4 countries in the years 1990, 1995, 2000, 2005. Summarise the information and Write at least 150 words.

The bar chart compares the proportion of government expenditure allocated to road and transport in Italy, Portugal, the UK and the USA between 1990 and 2005 at five-year intervals.

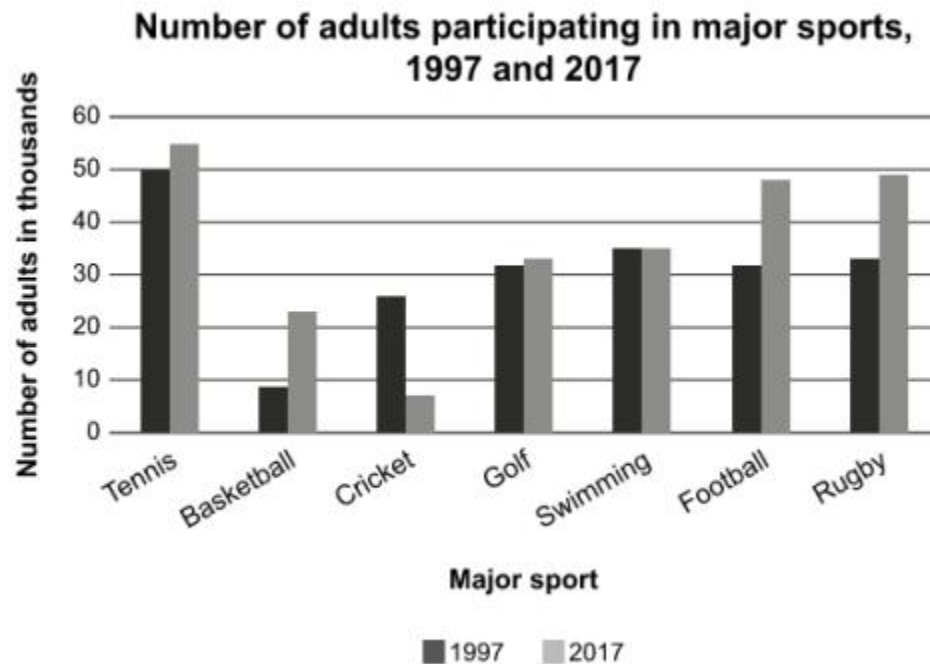

Overall, spending on this sector declined in all countries except the USA. In addition, Italy and Portugal consistently allocated a much larger share of their budgets to transport infrastructure than the UK and the USA.

In 1990, the USA devoted approximately 12% of its total government expenditure to road and transport, which was about 2% higher than the UK. Although this figure fell slightly to around 10% in 1995, it rose steadily afterwards, reaching about 15% by 2005.

In contrast, the three European countries experienced overall declines. Portugal recorded the highest level of spending at around 27% in both 1990 and 1995, before falling to about 20% by 2005. Similarly, Italy's expenditure decreased from approximately 23% to just under 20% over the period. Meanwhile, the UK allocated the smallest proportion, dropping from around 10% to roughly 7%, despite a brief increase in 2000.

Bar Chart

The chart below shows the number of adults participating in different major sports in one area, in 1997 and 2017. Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

The line chart compares the number of adults participating in seven different sports in a particular area in 1997 and 2017.

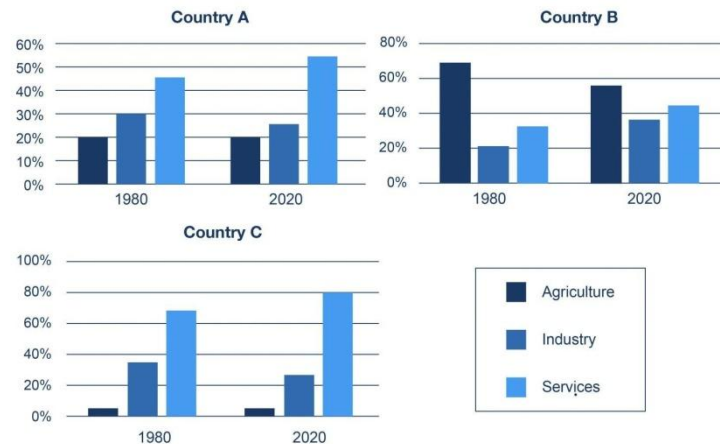

Overall, participation increased in most sports over the period, with tennis remaining the most popular activity in both years. In contrast, cricket was the only sport that experienced a significant decline.

In 1997, around 50 adults played tennis, making it the most popular sport. This figure rose slightly to approximately 55 by 2017. Football and rugby showed notable increases, rising from just over 30 participants in 1997 to about 50 in 2017.

Basketball also experienced substantial growth, with participation climbing from roughly 8 to more than 20 over the period. By contrast, cricket saw a sharp drop, falling from around 25 participants in 1997 to only about 9 in 2017.

Meanwhile, participation in golf and swimming remained relatively stable, with both sports attracting roughly 34 participants in each year.

The bar chart shows the distribution of employment among agriculture, services, industries in three countries in 1980 and in 2020.

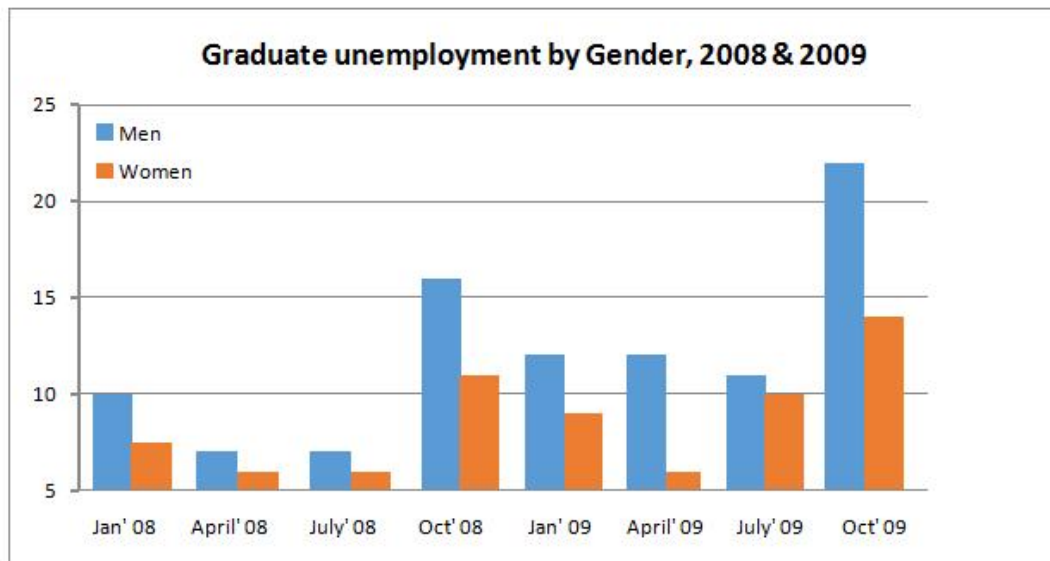

The charts illustrate the percentage of people working in agriculture, industry, and services in three different regions in 1980 and 2020.

Overall, employment in the service sector increased significantly in two regions, while agriculture declined. In contrast, the third region showed more fluctuation in the distribution of workers across the three sectors.

In regions A and B, agriculture accounted for the smallest share of employment. In region A, the proportion working in agriculture was about 20%, while in region B it was only around 5%. By contrast, the service sector experienced strong growth, reaching approximately 50% in region A and about 70% in region B by 2020. Industry remained relatively stable at around 30% in both regions.

In the remaining region, the percentages were different. Agriculture accounted for the highest share at about 50%, followed by services at roughly 40%, while industry had the lowest proportion at around 30%.

The bar chart below shows the percentage of unemployed graduates, aged 20-24, in one European country over a two-year period. Summarise the information by selecting and reporting the main features, and making comparisons where relevant.

The bar chart illustrates the unemployment rates among male and female graduates in a European country between January 2008 and October 2009.

Overall, unemployment rates increased for both genders over the period. In addition, male graduates consistently experienced higher unemployment rates than female graduates.

At the beginning of 2008, the unemployment rate among male graduates stood at 10%. This figure gradually declined to about 7% in April and remained stable until July. However, it rose sharply to over 15% in October before falling again to around 10%. After that, the rate fluctuated slightly until July 2009 and then surged to over 20% by October 2009.

A similar pattern was observed among female graduates. The unemployment rate fell from 8% in January 2008 to around 6% in July. It then increased to just over 10% in October and remained close to this level until mid-2009. Finally, the figure rose significantly to nearly 15% in October 2009.

Table

The graph below shows the number of people taking part in a wildlife survey in Britain between 2001 and 2009. Summarize the information by selecting and reporting the main features and make comparisons where relevant.

The number of people taking part in a wildlife survey in Britain between 2001 and 2009

Year	Adult	Children	Total
2001	36,000	12,000	48,000
2003	212,000	36,000	248,000
2005	332,000	32,000	364,000
2007	331,000	31,000	362,000
2009	270,000	270,000	540,000

The table shows the number of British adults and children who participated in a wildlife survey between 2001 and 2009.

Overall, participation increased significantly over the period, mainly due to a sharp rise in the number of adults taking part. In contrast, the number of children remained relatively low for most of the period before increasing dramatically in the final year.

In 2001, 36,000 adults participated in the survey. This figure rose steadily over the next few years, reaching a peak of 332,000 after five years. However, the number then declined sharply, falling to just 27,000 by the end of the period.

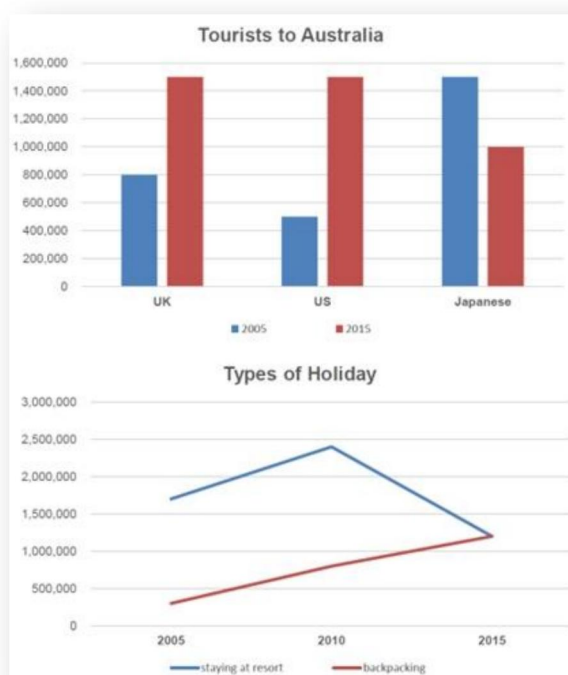

The number of children participating was much lower at the beginning, starting at 12,000. For most of the period, the figure fluctuated between 12,000 and 36,000. However, in the final year, participation increased sharply to 270,000.

As a result, the total number of participants rose dramatically from 48,000 in 2001 to 540,000 in 2009.

Multiple Graphs

The bar chart below shows the number of tourists in three nations who travel to Australia in 2005 and 2015. The graph below shows the number of tourists who use two types for holiday.

The bar chart shows the number of tourists visiting Australia from the UK, the US, and Japan in 2005 and 2015, while the line graph illustrates the number of tourists choosing resort holidays or backpacking between 2005 and 2015.

Overall, Australia became increasingly popular among visitors from the UK and the US, whereas the number of Japanese tourists declined. In terms of holiday types, resort stays initially dominated but decreased significantly by 2015, while backpacking steadily increased.

In 2005, Japan recorded the highest number of visitors to Australia, at around 1.5 million. By contrast, the UK and the US had fewer tourists, with approximately 800,000 and 500,000 respectively. However, by 2015 the figures for both countries had risen substantially to about 1.5 million, while Japanese visitors fell to roughly 1 million.

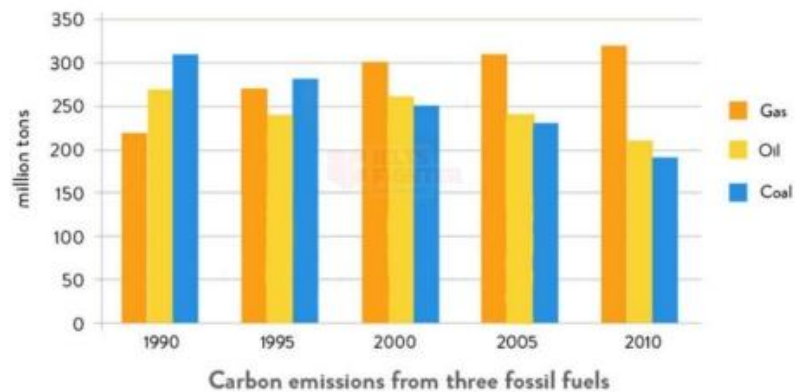

Regarding holiday types, about 1.7 million tourists stayed at resorts in 2005, compared with a much smaller number choosing backpacking. Resort holidays peaked at around 2.45 million in

2010 before falling sharply to 1.25 million in 2015. Meanwhile, backpacking increased steadily and eventually reached the same level as resort stays.

Bar Chart

The provided chart illustrates the three different kinds of emission sources of greenhouse gas in the UK.

Task 1: The graph below shows the three different kinds of emission sources (oil / coal / gas) of greenhouse gas in the UK. Summarize the information by selecting and reporting the main features and make comparisons where relevant.

The bar chart illustrates the amount of emissions produced by three fossil fuels in Britain between 1990 and 2010.

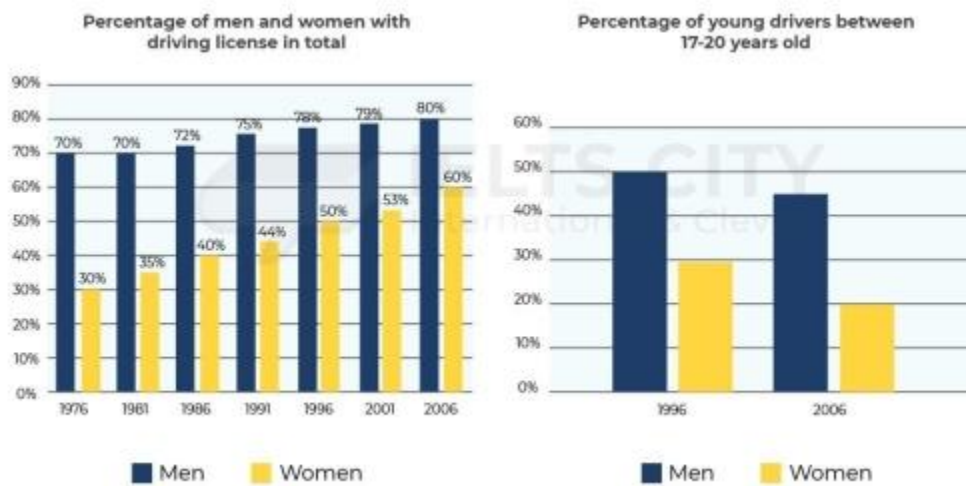

Overall, gas emissions increased steadily over the period, while coal emissions declined significantly. In contrast, oil emissions fluctuated but showed an overall downward trend.

In 1990, gas emissions were just over 200 million tons. This figure rose gradually over the next two decades, reaching a peak of nearly 325 million tons in 2010. By contrast, coal produced the highest level of emissions at the beginning of the period, at slightly above 310 million tons. However, this figure fell steadily throughout the period, dropping to around 190 million tons by 2010.

Oil emissions followed a different pattern. They started at approximately 275 million tons in 1990 before falling to about 240 million tons in 1995. The figure then increased slightly to around 260 million tons in 2000. After that, oil emissions declined again, reaching just under 200 million tons by 2010.

Multiple Graphs

A bar chart shows the percentage of men and women in Great Britain who had driving licenses and another bar chart shows the percentage of men and women who were young drivers at the age of 17-20.

The bar charts show the percentage of men and women in Great Britain who held driving licences between 1976 and 2006, as well as the proportion of young drivers aged 17 to 20 between 1996 and 2006.

Overall, the proportion of adults with driving licences increased steadily for both men and women during the 30-year period. In contrast, the percentage of young drivers declined over the final decade.

In 1976, around 70% of men in Great Britain held a driving licence, compared with only about 30% of women. Over the following years, the figures rose gradually. By 1986, the proportions had increased to approximately 72% for men and 40% for women. The upward trend continued, reaching 78% for men and 50% for women in 1996. By 2006, around 80% of men and about 60% of women held driving licences.

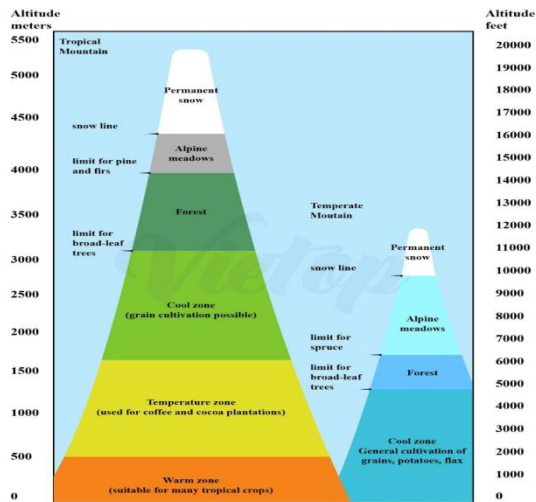

However, the proportion of young drivers showed the opposite trend. Among 17–20-year-olds, the percentage of male drivers fell from about 50% in 1996 to roughly 45% in 2006, while the figure for females declined from around 30% to about 20%.

WRITING TASK 1

You should spend about 20 minutes on this task.

The diagram shows differences in temperature zones between tropical mountains and temperate mountains.

Write at least 150 words.

Task 1: The diagram shows differences in temperature zones between tropical mountains and temperate mountains.

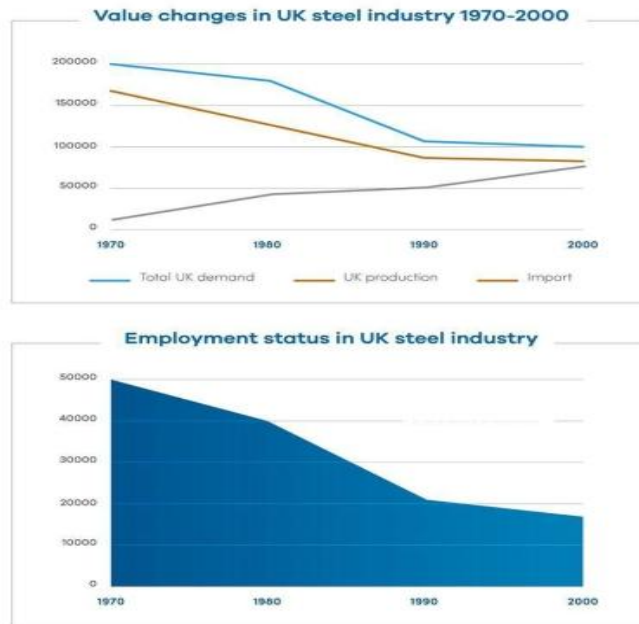

The diagram compares different altitude zones of vegetation and temperature on tropical and temperate mountains, based on changes in climate and land use at various elevations.

Overall, the tropical mountain has a wider range of distinct zones and supports vegetation at much higher altitudes. In contrast, the temperate mountain has fewer zones, and the limits for both tree growth and permanent snow occur at lower elevations.

On the tropical mountain, there are six zones in total. At the base, from 0 to 500 meters, is the warm zone where various tropical crops can be grown. This is followed by the temperature zone (500-1500m), which is suitable for coffee and cocoa plantations. The cool zone, between 1500 and 3000 meters, allows for the cultivation of grains. Above this, a forest zone stretches from 3000 to 4000 meters, where broadleaf and coniferous trees grow until the limit for pine and fir is reached. Alpine meadows cover the area between 4000 and about 4500 meters, and permanent snow is found above 4500 meters.

The temperate mountain, by comparison, has only four main zones. From 0 to 1200 meters is a cool zone where crops like grains, potatoes, and flax are grown. The forest zone lies between 1200 and 1700 meters and ends at the spruce tree limit. Above this, alpine meadows extend up to about 2900 meters, just below the snow line. Permanent snow appears above that point, beginning slightly below 3000 meters.

Word Count: 240

The graphs show the changes in the UK industry steel between 1970 and 2000. (million tonnes vs thousand)

The line graph compares the changes in the total demand for steel in the UK, its production and imports from 1970 to 2000, while the second graph shows the employment figures in this industry during the same period.

Overall, while the demand for steel and the production of steel in the UK both decreased, steel imports increased. In addition, there were fewer people working in this industry over the 30 year period.

In 1970, the total demand for steel in the UK was around 200,000, which was nearly ten times as high as the amount of steel it imported. Over the following three decades, both the demand and production of steel decreased by approximately 50%, while the amount of steel imported rose from approximately 10,000 to 25,000.

The number of people employed in the steel industry stood at 50,000 in 1970 when the demand for steel in the UK was high and the amount of steel imported was low. Over the following years, the employment figures in the steel industry continued to decline to around 18,000 in the year 2000.

Word Count: 180

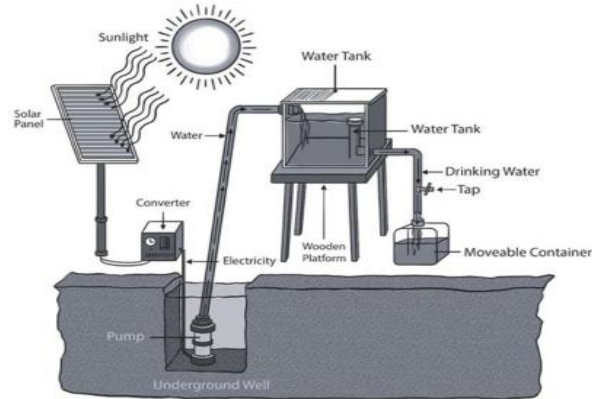

WRITING TASK 1:

You should spend 20 minutes on this task.

The process of producing drinking water by solar power powdered pump and filter.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

Write at least 150 words.

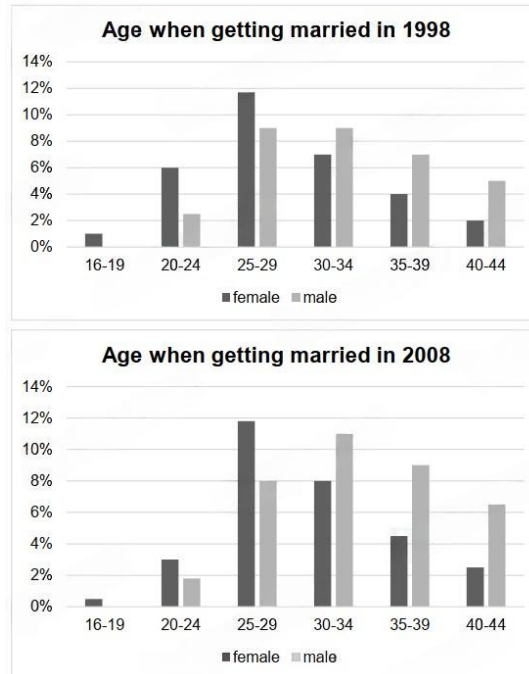

The diagram details the procedures by which drinking water is produced using a solar power powdered pump and filter.

The diagram illustrates the process of drinking water using solar energy and a filtration system. Overall, the system consists of several stages, beginning with the generation of electricity from sunlight and ending with the delivery of clean, drinkable water through a tap. The process is entirely powered by sunlight and depends on a combination of mechanical pumping and filtration to make underground water suitable for consumption.

At the first stage, sunlight is captured by a solar panel and converted into electricity. The electricity is then used to operate a pump that is installed at the underground well. As a result, water is drawn up from below ground and channeled through a pipe to the water tank which is situated at a wooden platform.

In the next stage, the water tank is filled with the extracted water where it undergoes filtration in order to eliminate impurities. After that, the purified water is kept briefly inside the tank. Eventually, the drinking water is released through a tap before it is gathered in a moveable container, making it ready for use.

Word Count: 178

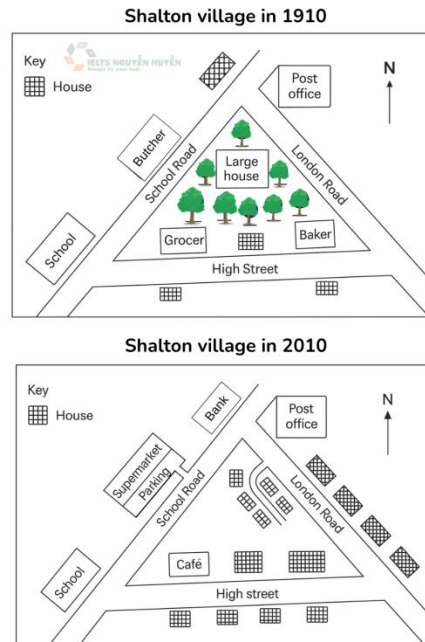

The charts below give information on the ages of people when they got married in one country in 1998 and 2008. Summarize the information by selecting and reporting the main features, and make comparisons where relevant.

The bar charts **illustrate** the percentage of people married in different age groups in 1998 and 2008.

In 1998, the percentage of married females was higher than male **counterparts** when they were under 30. Specifically, nearly 12% of females aged 25-29 got married while the figure was **significantly lower** with 6% for the 20-24 years old and 7% for the 30-34 years old, as the three highest groups. Males, however, were most likely to be married between 25 and 34 years old, with both proportions reaching 9%. **Elderly groups** showed more willingness to get married than females despite a lower proportion as age grew.

A decade later, though the **gender pattern** across age groups barely changed, it is **noticeable** that males over 30 all exhibited increased percentages by approximately 2%. By contrast, those under 30 **witnessed a slight decline** in figures. Women did not show significant changes except **a considerable fall** in the group 20-24, where the percentage dropped from 6% to 3%.

For people over 30, married men were higher in percentages than women, while the pattern was the opposite for people under 30. **Across age groups**, most men married between 30-34 years old, while women 25-29.

The maps below show a part of a village in 1910 and the same part of the village in 2010. Provide an overview of the information by identifying and describing the key details, and include comparisons where appropriate.

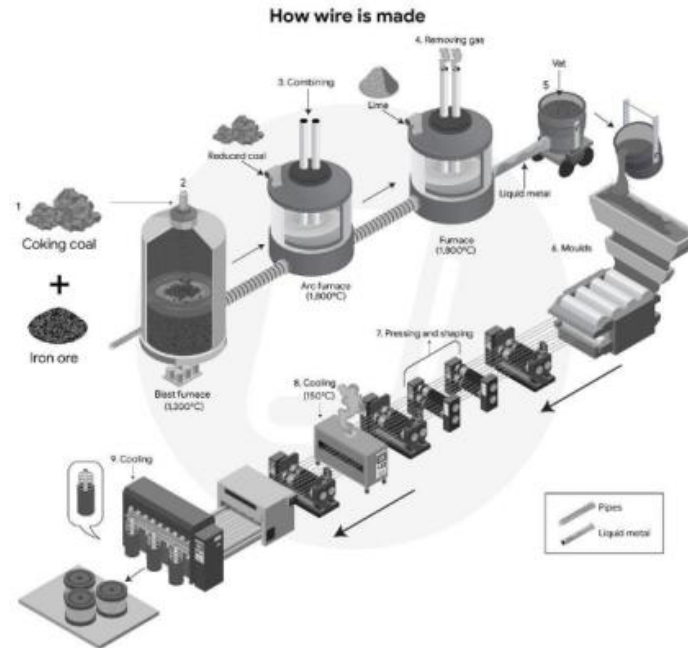

The maps illustrate the changes that took place in part of Shalton village between 1910 and 2010.

Overall, the village experienced considerable redevelopment, with many original shops and green spaces replaced by new public infrastructure, additional housing, and commercial facilities.

In 1910, School Road, London Road, and High Street intersected to form a triangular area at the heart of the village. Inside this area stood a large house surrounded by trees, located between School Road to the west and London Road to the east. High Street, along the southern edge, was lined with small shops such as a grocer and a baker, while a butcher's shop was situated further north along School Road. The post office was positioned on London Road, north of the triangle, and a school occupied the southwest corner of the map. Some houses were located along the southern side of High Street and on the northern part of School Road.

By 2010, the main road layout remained intact, but significant redevelopment had taken place within and around it. The large house and surrounding trees were replaced with a new side road and additional, smaller housing. The original shops on High Street were replaced by a café and a house, while a supermarket and parking area were constructed on the west side of School Road, where the butcher's shop had previously stood. A bank was constructed near the still-intact post office, and further houses appeared along London Road and to the south of High Street. Finally, the school in the southwest corner remained unchanged.

Word count: 240

The diagram below shows the process by which wire is made. Provide an overview of the information by identifying and describing the key details, and include comparisons where appropriate.

The given diagram illustrates the process of wire production.

Overall, it is a nine-step automated linear process, during which the mixture of coking coal and iron ore undergo temperature and mechanical treatment to be turned into wire.

In the first step, iron ore and coking coal are fed into a blast furnace, where they are heated to approximately 1300°C in order to produce molten iron. Following this, the liquid metal is transferred to an arc furnace, in which it is heated further to around 1800°C. Once this stage has been completed, lime is added during the combining process so that impurities can be removed, resulting in refined liquid metal.

At the next stage, the molten metal is poured into moulds to form solid metal bars. Afterwards, these bars undergo pressing and shaping, before being cooled at about 500°C. Having been cooled, the material is processed into pipes or wire, and the process ends when the finished products are ready for industrial use, thereby completing the production cycle.

Word Count: 167

The table provides data on the number of students enrolled in six different departments at an Australian university in 2009. Provide an overview of the information by identifying and describing the key details, and include comparisons where appropriate.

Students studying in six departments in an Australian university in 2009

Department	Females	First language not English	Born outside Australian
English	67%	16%	27%
Modern Languages	63%	41%	54%
History	58%	10%	18%
Physics	37%	38%	44%
Math	42%	36%	43%
Chemistry	29%	32%	47%

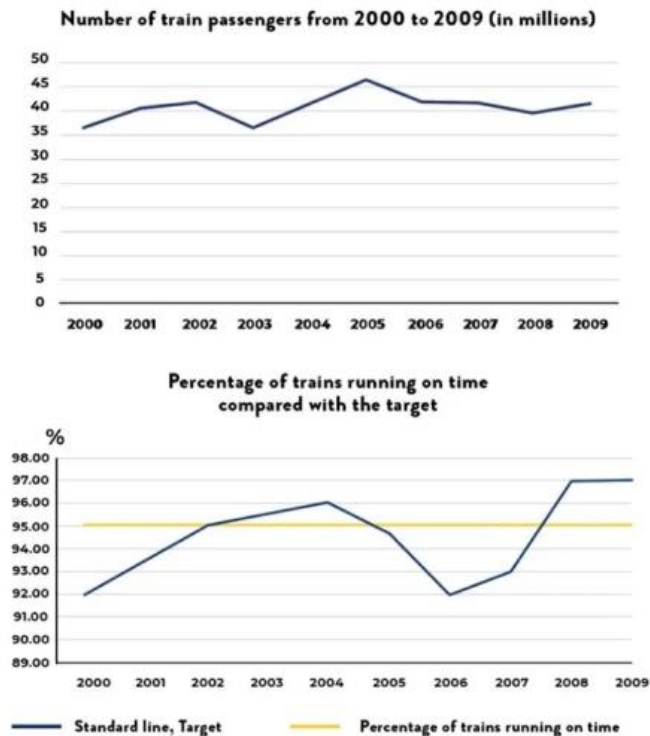

The table provides information on the gender, first language status, and birth origin of students in six departments at an Australian university in 2009.

Overall, females in the English, Modern Languages and History departments were predominant, whereas the opposite was true in the case of the remaining departments. Additionally, students whose first language was not English and those born outside Australia were generally less than half of the total student population across all departments, except for modern languages.

In terms of female enrollment, the English department recorded the highest proportion at 67%, followed closely by Modern Languages at 63% and History at 58%. In contrast, female representation was much lower in the sciences, with a 29% enrolment rate in the Chemistry department, 35% in Physics, and 42% in Math.

Students with a first language other than English were most prominent in Modern Languages, where they comprised 41% of the department. Conversely, the English and History departments reported much lower proportions, at 16% and 10%, respectively. The Physics, Mathematics, and Chemistry departments fell in between, with figures ranging from 32% to 38%. Regarding students born outside of Australia, figures were highest in the Modern Language department, at 54%. Other departments reported lower percentages, with History at the lowest, comprising just 18% international students. The Physics, Math, and Chemistry departments displayed similar figures, standing between 43% and 47%.

Word count: 226

The first graph shows the number of train passengers from 2000 to 2009. The second graph shows the percentage of trains running on time

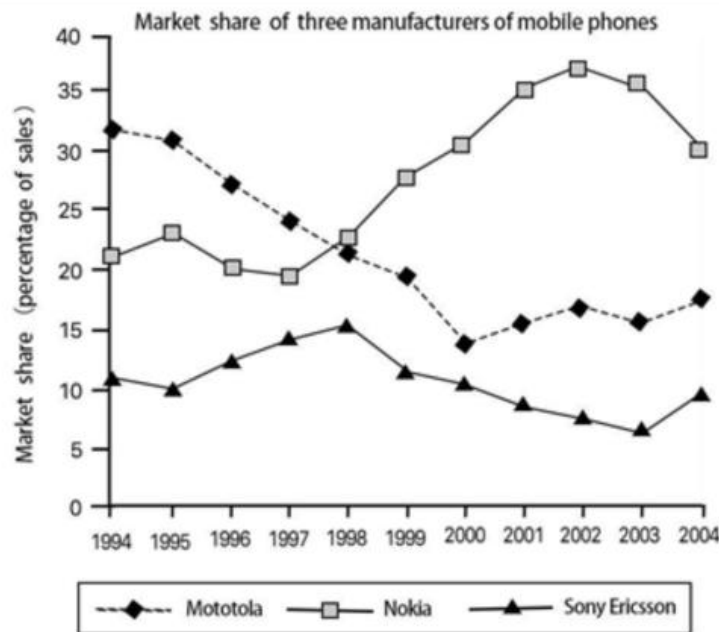

The first line graph illustrates the changes in the number of train passengers over nine years from 2000 to 2009, while the second compares the actual proportion of trains running on time with the target.

Overall, train ridership showed a gradual upward trend over the period, despite several short-term declines, while the punctuality rate of trains fluctuated considerably. Notably, the passenger numbers peaked in 2005, whereas the share of on-time services varied around a stable target, ending the period at its highest level.

In terms of train ridership, the passenger numbers experienced moderate growth, starting at 39 billion and rising to 42 billion by 2002. However, the number of railway travellers dropped to 39 billion in 2003. Subsequently, 48 billion rail passengers were reported in 2005. Rail ridership decreased slightly to 40 billion in 2008. It then rose to 44 billion in the final year.

Regarding the punctuality rate of trains, while the standard remained unchanged at 95%, the proportion of trains running on schedule saw an upward trend between 2000 and 2004, from 92% to 96%. The percentage of punctual trains fell markedly from 96% in 2004 to 92% in 2006. This figure reached a peak in 2008 at 97% and remained constant from 2008 to 2009.

Word Count: 208

The line graph below illustrates the proportion of mobile phone sales by three manufacturers (Motorola, Nokia and Sony Ericsson) between 1994 and 2004.

The line graph shows the percentage of mobile phone sales by three companies - Motorola, Nokia and Sony Ericsson - from 1994 to 2004.

Overall, market share of Motorola was initially the highest but then it decreased over the period. The proportion of Nokia's sales was relatively more stable at the beginning of the period and there was dramatic increase in its market share, becoming dominant at the end of the period. In contrast, the proportion of Sony Ericsson's sales was the lowest throughout the period.

Motorola's market share exhibited a downward trend overall. The company started the period with nearly 32% and this was followed by a considerable drop to approximately 15% in 2000. After declining, a minimal rise was seen in Motorola's sales to about 17% in 2004. By contrast, Nokia showed an upward trend for most of the period. There was a slight rise to almost 23% in 1995, before dipping to nearly 20% in 1997. Manufacturer's market share climbed consistently, reaching a peak at 37% in 2002. Although the proportion of Nokia's sale dropped to almost 30% at the end of the period, it maintained its dominance in the market.

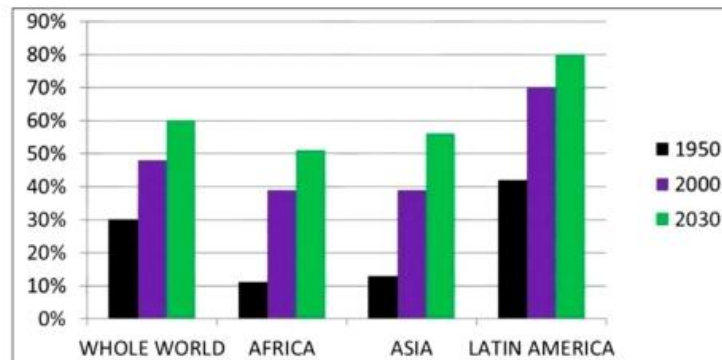

Sony Ericsson's market share showed relatively smaller numbers. Despite declining to about 9%, sales increased gradually to 15% in 1998. Even though the figure for Sony Ericsson dropped steadily to almost 5% in 2003, there was a recovery to nearly 10% at the end of the period.

Word Count: 241

You should spend about 20 minutes on this task

The chart below gives information about the growth of urban population in certain parts of the world including the prediction of the future.

Write at least 150 words.

The bar chart illustrates the proportions of urban populations in four distinct regions of the world - namely, the Whole World, Africa, Asia, and Latin America - across three pivotal years: 1950, 2000, and projections for 2030.

Overall, the data indicates a steady increase in urbanization across all regions, with significant variations in the levels of urban population. Latin America exhibits the highest urbanization rate, whereas Africa consistently remains the least urbanized region.

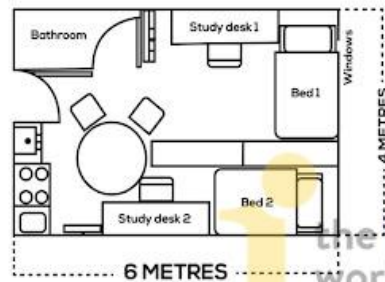

In 1950, approximately 44% of the global population resided in urban areas. Among the regions analyzed, Latin America boasted the most substantial urban population at nearly 20%. In contrast, Africa's urban population was exceptionally low at around 14%, while Asia reported about 32% urbanization. By the year 2000, the trend of urbanization had markedly accelerated, with the global urban population increasing to approximately 47%. Latin America experienced pronounced growth, reaching nearly 70%, while Africa and Asia recorded moderate increases to around 38% and 37%, respectively.

Looking ahead to 2030, projections suggest that the global urban population will rise to approximately 60%. Latin America is expected to peak with an urbanization rate of about 80%. In comparison, Africa and Asia are anticipated to experience modest increases, forecasted to reach approximately 53% and 55%. Notably, despite these upward trends, Africa is projected to maintain its status as the region with the lowest urban population share.

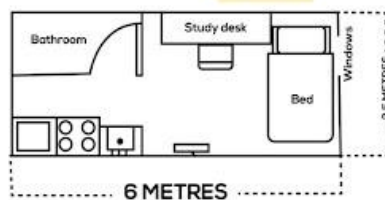

Word Count: 226

The plans below show a student room for two people and a student room for one person at an Australian University.

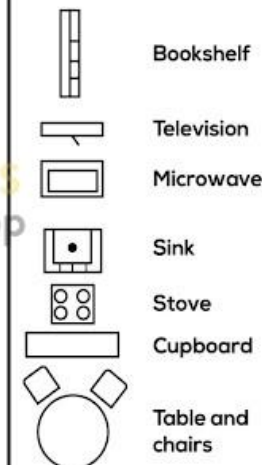

Student room for two people, \$350/week

Student room for one person, \$200/week

KEY

The given picture illustrates the discrepancy between a dorm for two students and that for one at a university in Australia.

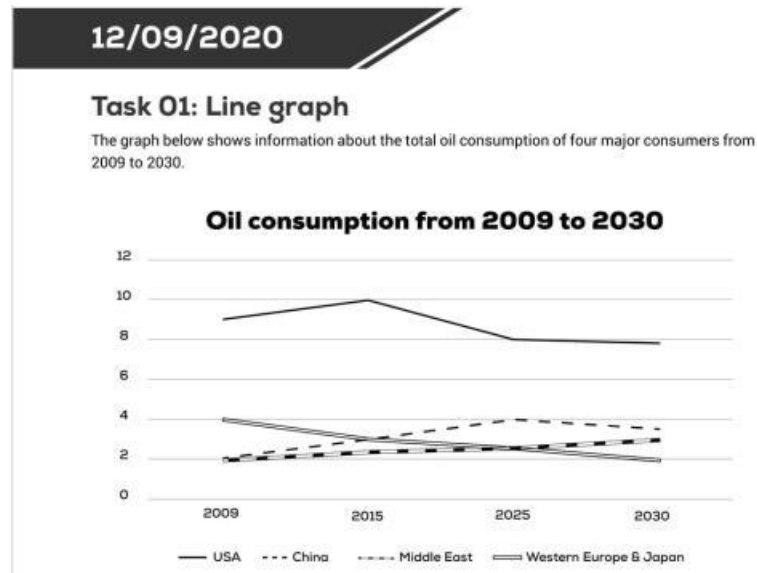

Overall, the room for two students appears to be larger in size and is more well-furnished, compared to that for one student. Additionally, rental fee also contributes to the difference between these two types of room.

Comparing the single-bed room with the upper part of the double-sized room, the differences are not noticeable. Both rooms are 6 metres in length, yet the dorm for two people is 1.5 metres greater in width. The bedroom for one student matches the upper half of the room for two with the same placement of bed, window, desk, and bathroom. Opposite the bathroom and student's desk is a set of cooking appliances, namely microwave, stove, sink, and TV. However, no bookshelf is furnished in the dorm for one person.

The bigger bedroom consists of better household appliances, which casts a feeling of space inadequacy. The room is separated into two halves with some cupboards which are adjacent to a circular dinner table that faces the cooking area. The lower half of the room is some private space for another student with the arrangement of desk, aligned with a television to the left. In general, the bedroom for two may provide students with some space for dual activities, yet it makes the room seem less spacious compared to the room for one.

Word Count: 238

The graph below shows information about the total oil consumption of four major consumers from 2009 to 2030.

The line graph gives information about the oil consumption of four different regions from 2009 until present, and predicted figures until 2030. Units are in millions of barrels per day.

Overall, the USA was by far the biggest consumer of oil from 2009 until present and is predicted to remain the biggest consumer until 2030.

In 2009, oil consumption in the USA was around 9 million barrels per day. This figure rose to around 10 million barrels per day in 2015, before beginning to fall. Figures are predicted to continue falling to around 7.5 million barrels per day by 2030. Meanwhile, oil consumption in Western Europe and Japan was around 4 million barrels per day in 2009 and has been in decline since. Figures are predicted to reach 2 million barrels by 2030.

Oil consumption in China and the Middle East was around 2 million barrels per day each in 2009. By 2030, figures for China and the Middle East are predicted to reach 3.5 and 3 million barrels per day respectively.

(174 words)

Or,

The chart compares how much oil was consumed by four different countries (the United States, China, the Middle East and Japan) between 2009 and 2030. Counts will be given in tones.

Overall, whilethe other three countries (China, the Middle East, Western and Japan) have a small consumption of lube, America stands at the highest degree.

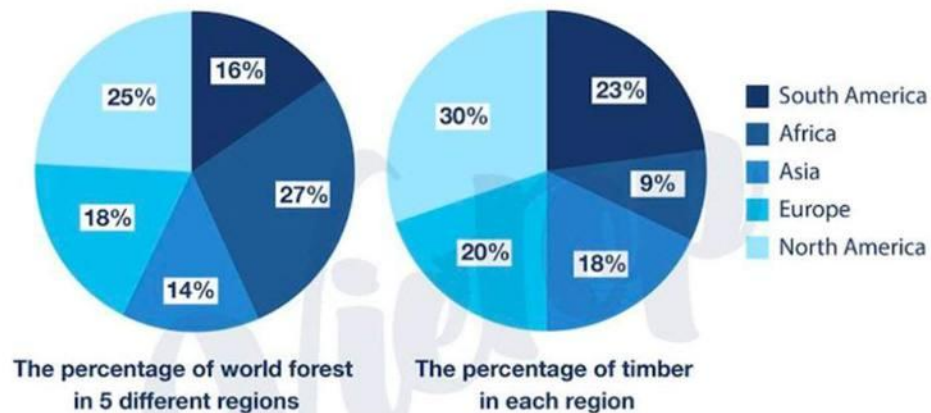

As a graph shows, in 2009, China absorbed 2 of the lard, but this rate increased steadily to 4. But, there will be a slight decrease to just under 4 by 2030. In terms of the Middle East's cotton consumption, it was the 2 in 2009, with predictions that it will have a slight increase by 2030.

By contrast, Japan had a 4-ton consumption of grease in 2009. However, this figure fell slightly to just above 2 in 2025. Otherwise, it will continue like that, and it will be exactly 2 in 2030, with predictions. Regarding the slick absorption of America, in 2009, they drank 9. Despite that, they experienced a small increase to 10. However, there was a steady decline to 8 in 20025. Then, this figure levelled off at 8 in 2025, and it will not change by 2030.

The pie charts give information about the world's forest in five different regions. Summarize the information by selecting and reporting the main features, and make comparisons where relevant.

The pie charts give information about the world's forest in five different regions.

Summarize the information by selecting and reporting the main features, and make comparisons where relevant.

The data presents the percentage of the world's forest in five distinct areas. The figures are illustrated using two pie charts, which compare forest area and timber distribution worldwide.

In general, Europe, Asia, North America, and South America display a slight gap between the two pie charts. On the other hand, Africa, which is the highest on the left circle, becomes the lowest on the right side, showing a clear contrast.

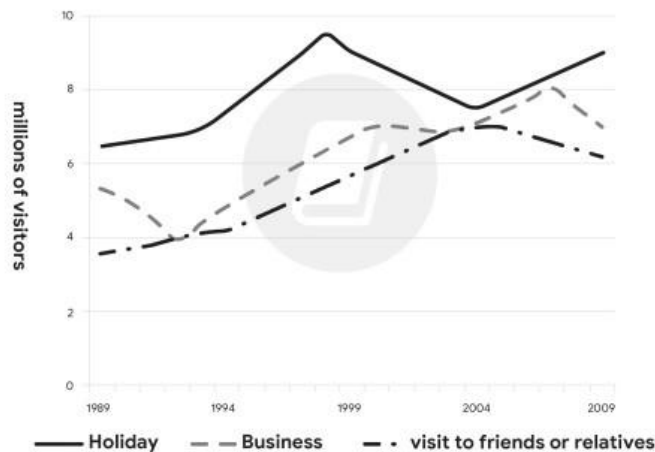

Firstly, Africa, which takes the largest part, with 27%, has the smallest proportion of timber, at 9%. Following North America, which is the second-biggest forest area in the world, accounting for 25%, there is a huge section of 30% in the timber population.

However, Europe, Asia, and South America don't exhibit any significant changes overall. Starting with Europe, standing in third place with 18%, increases by 2% in timber. South America and Asia, with 14% and 16%, show a slightly bigger difference of 18% and 23% between the two figures.

Word Count: 161

The graph below shows the number of overseas visitors who came to the UK for different purposes between 1989 and 2009.

The graph below shows the number of overseas visitors who came to the UK for different purposes between 1989 and 2009

The line graph illustrates the number of foreign visitors traveling to the UK for three different purposes—holiday, business, and visiting friends or family—over a 20-year period from 1989 to 2009.

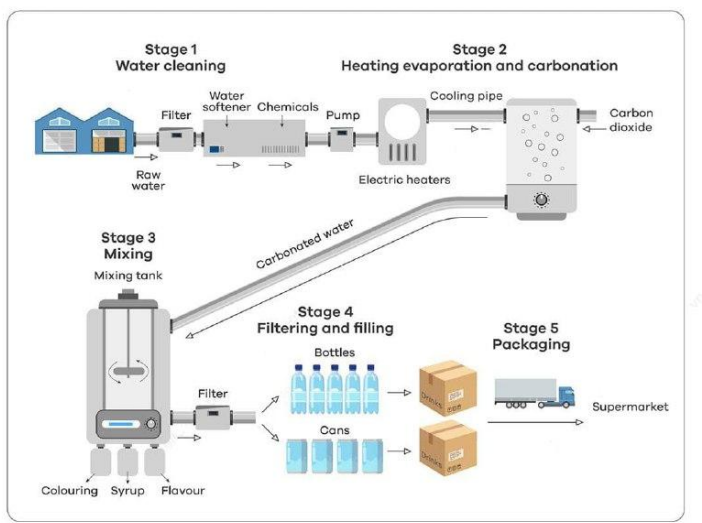

Overall, the number of visitors for all purposes experienced an upward trend throughout the period. Additionally, holidays consistently remained the most common reason for visiting the UK, while visiting relatives was the least popular purpose.

For holidays, the number of visitors was under 6 million in 1989. By 1999, it had nearly reached 10 million, marking the peak of the period. However, in the following years, the number experienced a downward trend, falling to approximately 7.5 million. Despite this decline, holidays remained the most popular purpose for visiting the UK and showed a general increase over the 20-year period.

On the other hand, the numbers for business trips and visits to friends or relatives rose steadily over the years. At the beginning of the period, business trips accounted for nearly 5 million visitors, while visits to friends and relatives stood at 4 million in 1989. Despite this rising trend, both purposes saw a decrease by the end of the period.

Word Count: 190

The diagram shows the process of manufacturing bottled and canned water.

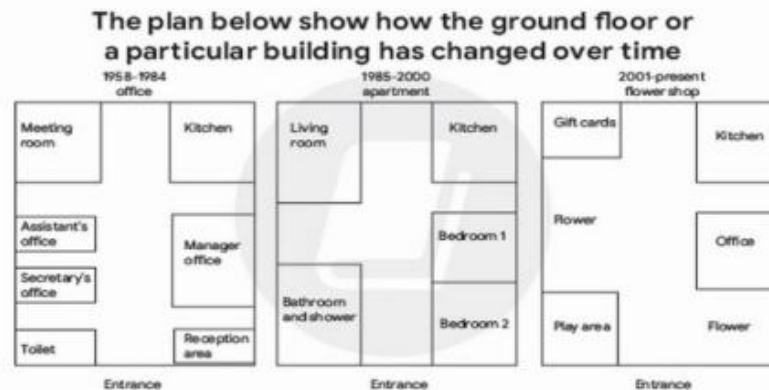

The flow chart shows how canned and bottled water is made. In general, there are about 15 distinct stages in this linear process which can further be grouped into 5 main sets: cleaning, carbonation, mixing, filling, and packaging.

At the first phase in the process, raw water from a tap is sent to a pump, being filtered, softened, and chemically treated along the way. The pump then channels the water to electric heaters, from where it is directed to a large tank of carbonation via a cooling pipe.

Once carbonated, the water is directed to a mixing tank with the use of a long pipe. In this tank, two phases happen simultaneously, which are adding additives like coloring, syrup and flavor to the water and mixing the liquid with a propeller rotating in a counter clockwise direction. Following this, the liquid is filtered again before being either bottled or canned. Finally, the drinks are boxed and readied to be dispatched to supermarkets for consumption.

- Task 1: The plans below show how the ground of a particular building has changed over time. Summarize the information by selecting and reporting the main features.

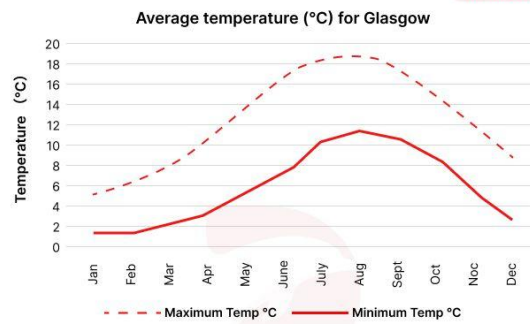

The provided floor plans depict the evolutionary alterations of a specific building's ground structure over a span of 43 years.

Overall, the transformation is significant, transitioning from a professional office layout to a residential environment, and ultimately evolving into a commercial flower shop.

Initially, during the period from 1958 to 1984, the layout was primarily composed of various office spaces, including a secretary's office, an assistant's office, and a manager's office, alongside communal areas such as a meeting room and a reception area. However, a notable shift occurred in 1985 when substantial renovations transformed the space into an apartment configuration, introducing essential amenities such as a bathroom with a shower, along with two bedrooms. This reallocation effectively met the residential needs of that timeframe.

The latter transformation, from 2001 to the present, further underscores the building's adaptability as it was repurposed into a flower shop, incorporating a distinct layout that includes a flower section, a play area, and a dedicated office space, all of which are accessible via entrances positioned centrally at the bottom of the plan. The area that previously housed a meeting room has been converted into a space for selling gift cards, while the kitchen remained unchanged throughout the entire period, demonstrating its enduring utility amid the other significant modifications.

Average rainfall (cm) and sunshine (hours per day)

Month	Average Rainfall (cm)	Average Sunshine (hours/day)
Jan	11	1
Feb	10	2
Mar	7.5	2.5
Apr	6.5	3
May	6	5.5
June	6.5	6
July	10	5.5
Aug	9.5	5
Sept	10	4
Oct	11	3
Nov	12	2.5
Dec	12.5	1

The charts below give information about the weather for Glasgow, a city in Scotland.

The charts provide data on Glasgow's weather, showing **average monthly temperatures** alongside figures for rainfall and daily **sunshine hours** throughout the year.

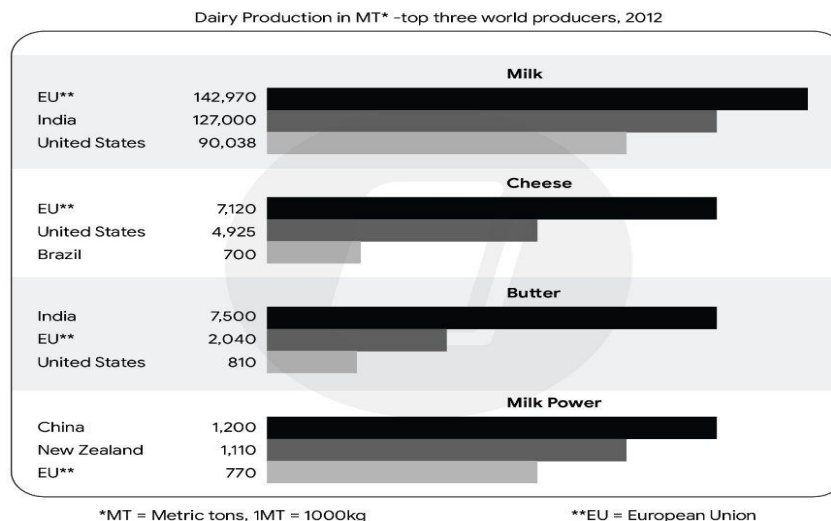

Overall, temperatures climb steadily from January to a peak in August before declining towards December, with the coldest months at the beginning of the year and the warmest in late summer. In addition, rainfall reaches its lowest point in May and rises to its maximum in December, while sunshine hours **climb to a peak** in June and dip to their minimum in both January and December.

From January to February, average temperatures remain **virtually unchanged** at around 1 °C. They then increase gradually through spring, reaching approximately 8 °C in May. Summer months **see further warming**, with temperatures climbing to about 12 °C in August. Thereafter, values **fall steadily, returning** to roughly 4 °C by December.

Examining **precipitation and sunshine levels**, rainfall begins at 11 cm in January, decreases to its lowest level of 6 cm in May, and then rises again to reach 12.5 cm in December. Conversely, daily sunshine lasts just 1 hour in January, **increases to a high of 6 hours** in June, and **subsequently diminishes** back to 1 hour by year's end.

The charts below give information about the world's top three producers of four different dairy products in 2012.

The charts below give information about the world's top three producers of four different dairy products in 2012.

The bar charts illustrate the production volumes of four different dairy products by the world's top three producing countries in 2012.

Overall, the European Union (EU) was **the leading producer** of milk and cheese, whereas India and China were the biggest producers of butter and milk powder respectively. Additionally, the total production of milk **outstripped** the other dairy products listed, while the opposite was true in the case of milk powder.

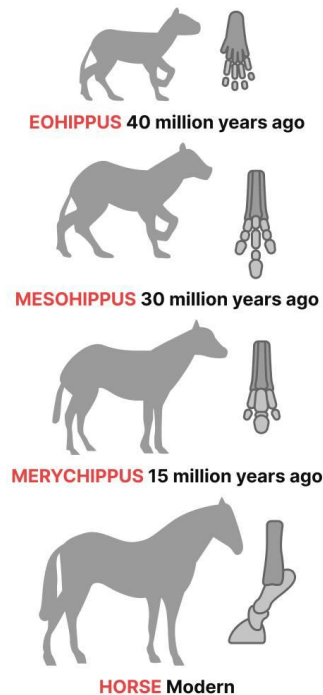

Regarding milk, the EU's production stood at an impressive 142,970 metric tons, exceeding India's production by approximately 16,000 metric tons and that of the United States by over 50,000 metric tons. In cheese production, the EU's total **output** for 2012 was 7,120 metric tons, significantly higher than the 4,925 metric tons produced by the United States and the mere 700 metric tons by Brazil.

Meanwhile, India was at **the forefront** of butter production, producing 7,500 metric tons, more than three times that of the US and the EU's production figures. Despite remaining one of the top three manufacturers, the EU **fell behind** China and New Zealand in milk powder production, producing 770 metric tons, in comparison to China's 1,200 metric tons and New Zealand's 1,110 metric tons.

Word count: 206

Process Diagram

The diagram shows how the horse evolved through time, with particular emphasis on its foot structure.

The diagram depicts the evolution of the horse over a period of 40 million years, with a concentration on its foot structure.

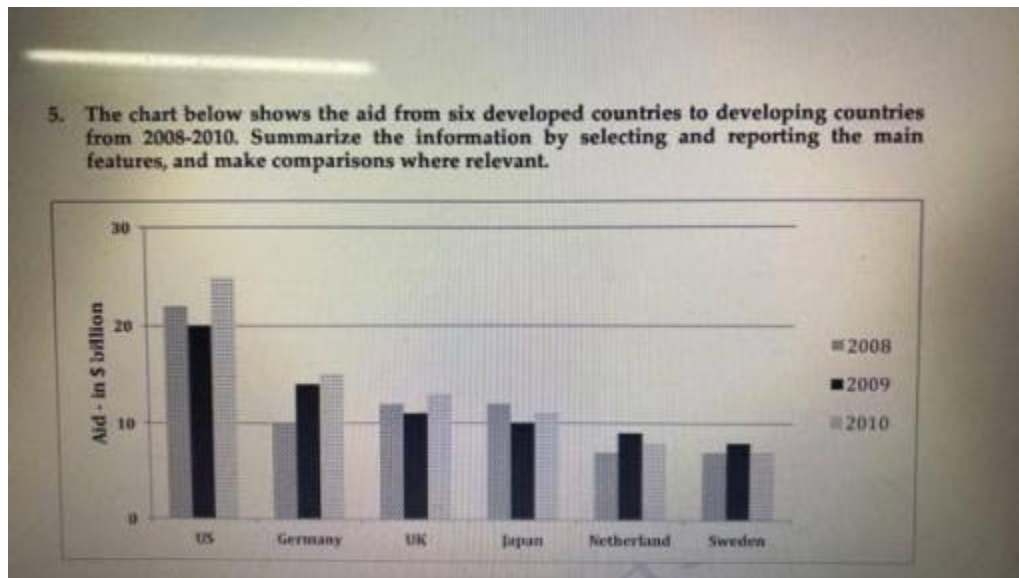

Overall, The horse has significantly increased in size from its ancestor, Eohippus, to the contemporary horse. Another important feature is the progressive simplification of its toe structure.

Approximately 40 million years ago, Eohippus, which had a dog-like size, characterized by a short head and neck, developed five toes, four of which bore small hooves, while the fifth remained elevated. Dating back to 30 million years ago, Mesohippus emerged as an intermediary species, exhibiting a larger and more slender physique, and ambulating on 3 toes.

By 15 million years ago, Mesohippus had transformed into Merychippus, marking a significant milestone in equine evolution. While still retaining the primitive trait of three toes, Merychippus resembled a modern horse, featuring an elongated face, a newly-formed mane, and a larger body. Ultimately, the contemporary horse, derived from Merychippus, now possesses a single hoof, slim legs, an elongated head, a relatively extended neck, and a lengthy tail.

Word Count: 173

The chart below shows the aid from six developed countries to developing countries from 2008-2010. Summarize the information by selecting and reporting the main features, and make comparisons where relevant.

The bar chart shows the amount of foreign aid given by six developed countries to developing countries between 2008 and 2010, measured in billions of dollars.

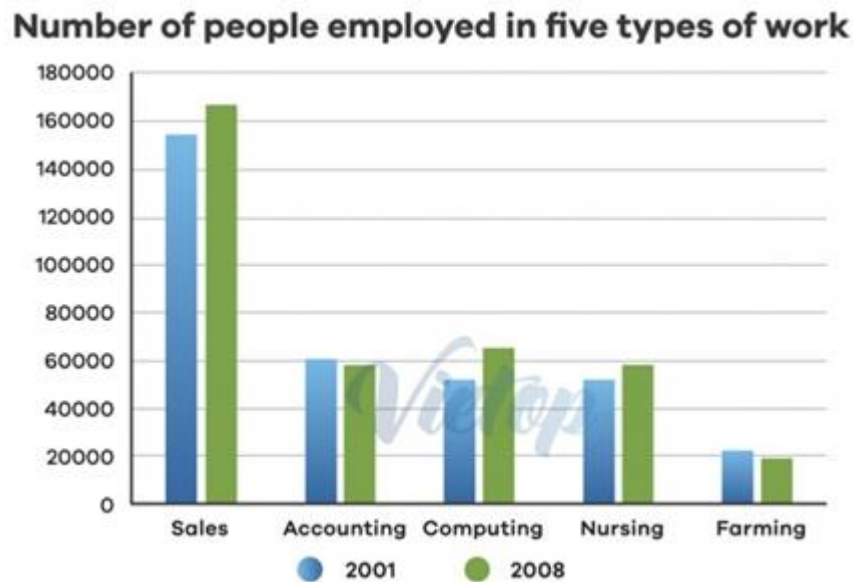

Overall, the USA provided by far the highest level of aid in all three years, while Sweden and the Netherlands donated the least. In general, most countries increased their aid over the period, although some figures remained fairly stable.

Looking first at the USA, aid rose steadily from about 21 billion dollars in 2008 to 25 billion in 2010. The UK also showed an upward trend, increasing from roughly 9 billion to around 13 billion dollars. Similarly, Germany's contribution grew slightly, from approximately 11 billion in 2008 to about 12 billion in 2010.

Japan gave around 11 billion dollars in 2008 and 2009, and this figure stayed almost the same in 2010. Aid from the Netherlands increased moderately from about 6 billion to nearly 8 billion dollars. In contrast, Sweden's aid fell slightly over the period, from around 7 billion in 2009 to about 5 billion in 2010.

Word Count: 174

The chart below give the number of people employed in five types of work in a certain region in Australia in 2001 and 2008.

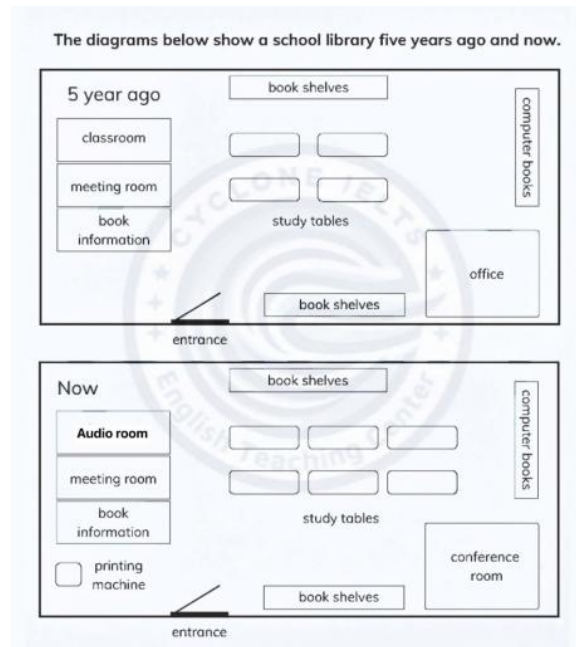

The provided bar chart illustrates the volume of people employed in five different sectors in a particular area of Australia in 2001 and 2008.

Looking from an overall perspective, there was a slight rise in the numbers of employees in sales, computing, and nursing, whereas a downward trend was witnessed in the field of accounting and farming. Furthermore, it is evident that the sales sector employed the most individuals, while farming employed the least in both years.

In 2001, nearly 160,000 people were employed in sales, significantly outnumbering the other realms listed in the chart. While the figures for accounting, computing, and nursing each stood at around 60,000, the agricultural sector recorded the smallest workforce, with approximately 30,000 workers.

By 2008, employment in sales had increased slightly to just over 160,000, still leading as the most populous workforce. Although computing and nursing followed the similar patterns as sales, computing observed a considerable upward trend, growing up to just under 80,000, whilst the number of workers in nursing sector rose moderately to 60,000. Conversely, declines were seen in the accounting and farming workforces, with the former falling slightly to just below 60,000 and the latter to just under 20,000.

Word Count: 198

The diagrams compare the layout of a school library from five years ago to its current design, showing various changes and additions.

Overall, the most noticeable changes are the addition of a new audio room, a printing machine, and a conference room in the current layout, replacing the classroom and office that existed five years ago. However, the general arrangement of the study tables, computer books, and bookshelves has largely remained unchanged.

Five years ago, the library contained a classroom and an office. The classroom was located on the left side near the entrance, followed by a meeting room and a book information area. There were two sets of bookshelves—one located along the top edge of the library and the other near the bottom. Additionally, study tables were placed in the center of the room, while computer books were positioned on the right wall, next to the office.

In the present layout, the classroom has been replaced by an audio room, and the office has been transformed into a conference room. A printing machine has also been added close to the entrance. However, the arrangement of the study tables, bookshelves, and the computer books section remains unchanged. The meeting room and book information area are still located on the left side of the library, indicating only minor adjustments in the overall design.

Word Count: 222

Table

The table shows the number of employees and factories producing silk in England and Wales between 1851 and 1901.

Write at least 150 words.

Year	Male	Female	Total employees	Factories
1851	53.964	76.786	130.750	272
1861	41.936	67.933	109.869	761
1871	38.102	53.310	91.412	693
1881	25.766	32.138	67.904	702
1891	28.689	30.336	49.025	663
1901	13.375	25.567	38.942	623

The table gives information about the changes in the average number of males, females, and factories in the silk industry across two countries over 50 years, commencing in 1851.

Overall, it is clear that while the figure for staff working at the factory fell consistently, there were considerable fluctuations in the number of silk manufacturers throughout the period shown.

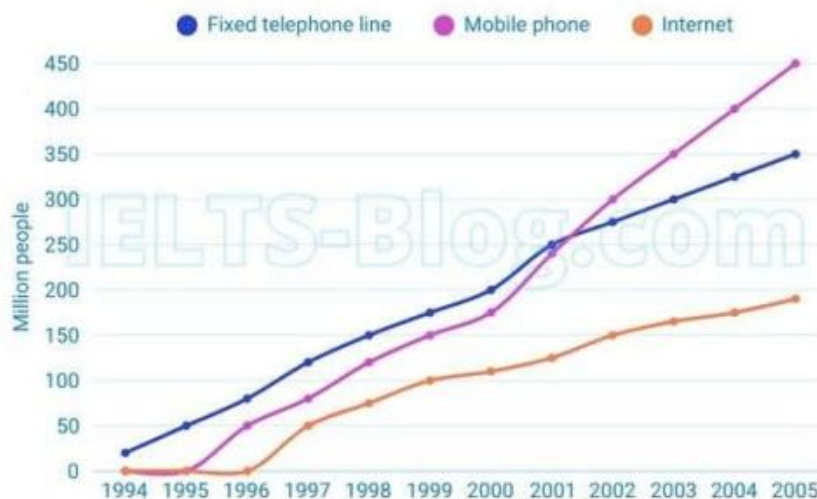

Examining the details, in 1851, the silk workforce started at its largest figure, roughly 130,750 people, including 53,964 males and approximately 77,000 females. Over the subsequent 50 years, the total employees exhibited a steady decline; there was a near fourfold decrease in the number of males, and the number of females dropped threefold by 1901, to about 13,375 and nearly 26,000 respectively. Notably, female-dominated labor prevailed over this time frame.

Conversely, despite being variable, the number of factories maintained a relatively high level. Beginning with 272 branches and increasing suddenly in the subsequent 10 years, reaching a peak of approximately 762 branches. Finally, there was a gradual fall in the number of factories from 761 in 1861 to 623 in 1901.

Word Count: 180

Line Graph

The graph below describes the use of fixed telephone lines, mobile phones, and internet between 1994 and 2005 in China.

The line graph illustrates the number of users of fixed telephone lines, mobile phones, and the internet in China from 1994 to 2005.

Overall, all three types of communication services showed an upward trend throughout the period. While mobile phone usage experienced the most significant growth, internet usage remained the lowest among the three.

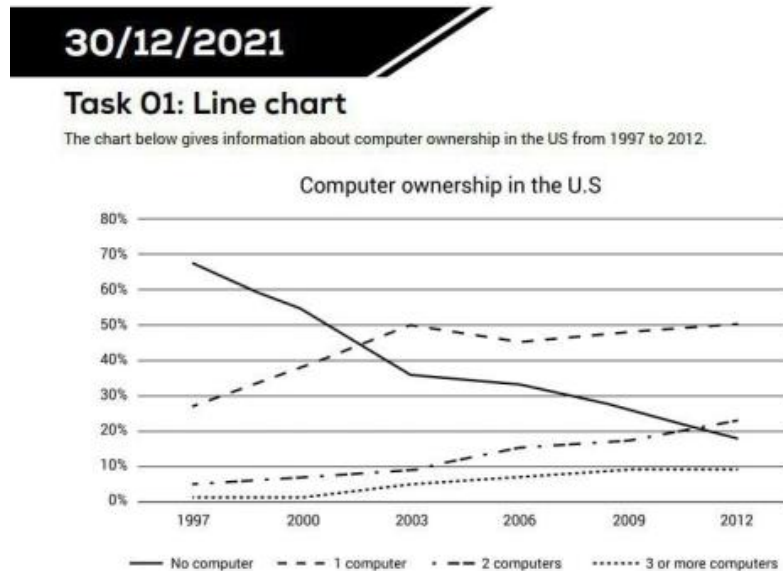

In 1994, both fixed telephone lines and mobile phone users were at low levels, below 10 million. The number of landline users increased steadily, reaching around 300 million by 2005. Mobile phone usage grew more slowly at first but started rising rapidly after 1998 and overtook landlines in 2003. By 2005, mobile phone users had reached about 420 million, the highest among the three.

The number of internet users began increasing after 1995. Though the growth was continuous, it was not as fast as the other two categories. By the end of the period, internet usage reached slightly over 100 million.

Word Count: 155

Line Graph

The chart below gives information about computer ownership in the US from 1997 to 2012.

The line graph illustrates changes in computer ownership in the United States between 1997 and 2012, categorized by the number of computers per household.

Overall, computer ownership became significantly more widespread over the period. The proportion of households without a computer declined markedly, while ownership of multiple computers rose steadily. Although one-computer households initially increased and became the largest category, their figure fell slightly towards the end of the period.

In 1997, approximately 60% of households did not own a computer, making it the largest category at that time. However, this figure decreased consistently throughout the period, reaching just under 20% by 2012. In contrast, the percentage of households with one computer rose from about 35% in 1997 to a peak of roughly 50% in 2001, overtaking those without a computer. After this peak, the proportion declined gradually to around 45% in 2012, though it remained one of the dominant categories.

Meanwhile, households owning two computers experienced steady growth. Starting at only about 5% in 1997, this figure increased significantly to approximately 30% by 2012. A similar but less dramatic upward trend can be observed for households with three or more computers, rising from around 2-3% at the beginning of the period to roughly 15% by the end. Despite remaining the smallest category overall, this group showed consistent growth.

In summary, the data clearly indicate a shift from having no computer to owning one or more devices, particularly multiple computers, over the fifteen-year period. (Word Count: 244)

Table

The table below shows the percentage of main types of dwelling in Victoria, the Northern Territory and Tasmania.

The table below shows the percentage of main types of dwelling in Victoria, the Northern Territory and Tasmania.

IELTS NGUYỄN HUYỀN

Types of dwelling	Victoria		The Northern Territory		Tasmania	
	2001	2006	2001	2006	2001	2006
House	79	76	65	63	88	89
Semi-attached house	11	12	13	15	3	4
Flat/Apartment	9	10	8	15	7	6
Other	1	2	14	15	2	1

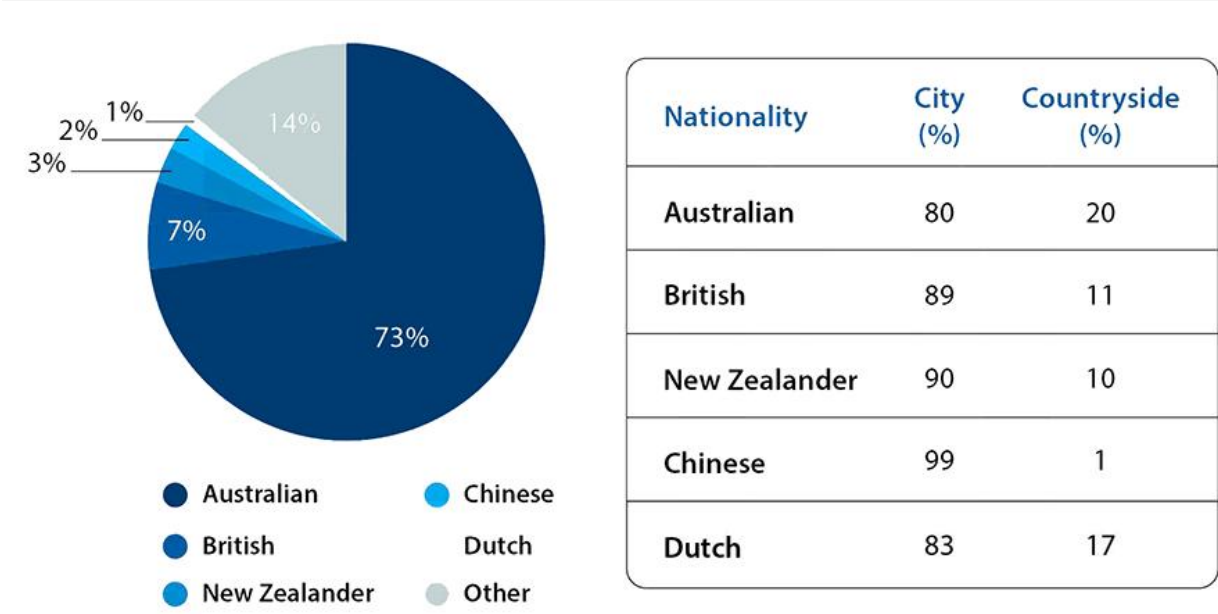

The table illustrates the percentage of four types of places of residence in Victoria, the Northern Territory, and Tasmania in 2001 and 2006. Overall, a significantly larger number of people lived in houses in all the regions mentioned, whereas fewer people chose to live in other types of dwellings, with the exception of the Northern Territory.

In Victoria, 79% of people resided in houses in 2001, which decreased to 76% in 2006. The percentages of those living in semi-attached houses, flats/apartments, and other types of residences were 11%, 9%, and 1%, respectively, all of which increased by 1% over the next five years.

Turning to the Northern Territory, about two-thirds of the population lived in houses (65%) in 2001, which dropped to 63% in 2006. The shares of semi-attached houses, flats/apartments, and other types of residences were 13%, 8%, and 14%, respectively, with all three categories increasing to 15% by 2006.

Word Count: 151

The table and pie chart give information about the population in Australia according to different nationalities and areas.

The given pie chart illustrates the percentages of different nationalities that make up the Australian population, while the table gives information about whether they live in urban or rural areas.

In general, it is evident that the vast majority of Australia’s population is of Australian nationality. Furthermore, most people in this country, irrespective of their nationality, opt to live in cities.

The percentage of the Australian population that are of Australian nationality is 73%, whereas the figures for people of British or other nationalities are significantly lower, at 7% and 14% respectively. Meanwhile, 3% of the population come from New Zealand, while 2% are of Chinese nationality. 1% of Australia’s population comes from the Netherlands.

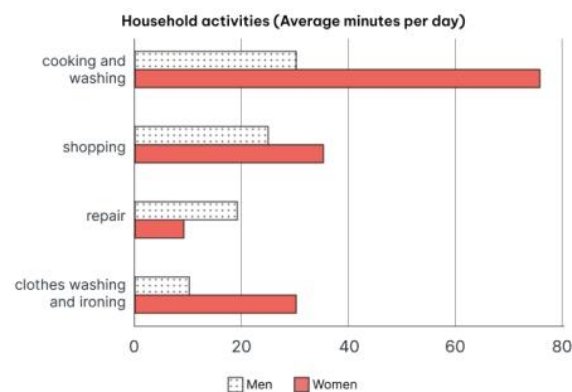

From the table it can be seen that 80% of Australians choose to reside in cities, along with 89% of the British and 90% of the New Zealanders. Similarly, 99% of Chinese live in the city, as do 83% of the Dutch.

(157 words)

Table

The charts below show the comparison of time spent, in minutes per day, by UK's males and females on household and leisure activities in 2008.

Leisure activities (Average minutes per day)	Men	Women
TV, video, radio	137	118
Reading	18	19
Sport	15	11

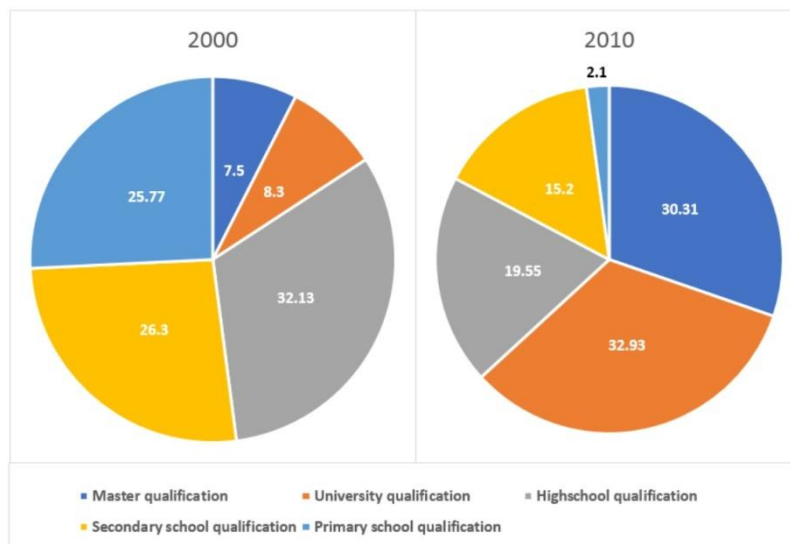

The bar chart and table illustrate how much time men and women in the UK allocated to housework and entertainment in 2008. Units are measured in minutes per day (mins/day).

Overall, the most popular leisure activities for both genders were watching TV, videos, and listening to the radio, while cooking and washing dishes were the most time-consuming household chores. Notably, men spent more time on most leisure activities compared to women, who dedicated significantly more time to household tasks.

In terms of recreational pursuits, watching TV, videos, and listening to the radio were by far the most common, with men spending more time than women (137 compared to 118 mins/day). Reading, however, was the only activity in which women invested more time than men, with respective figures of 19 and 18 mins/day.

As for household chores, women devoted the most time to cooking meals and washing dishes, at 75 mins/day on average, approximately double the figure for males, at about 30 minutes. The next most time-consuming activity for both genders was shopping, with women averaging around 35 and men roughly 25 mins/day. This pattern continued with clothes-related chores, where women spent 30 mins/day, three times the amount men did. In contrast, the amount of time men spent on repairs was twice as much as that of women, at nearly 20 mins/day.

The charts show average levels of participation in education and the highest education level of adults from 2000 to 2010 in Singapore.

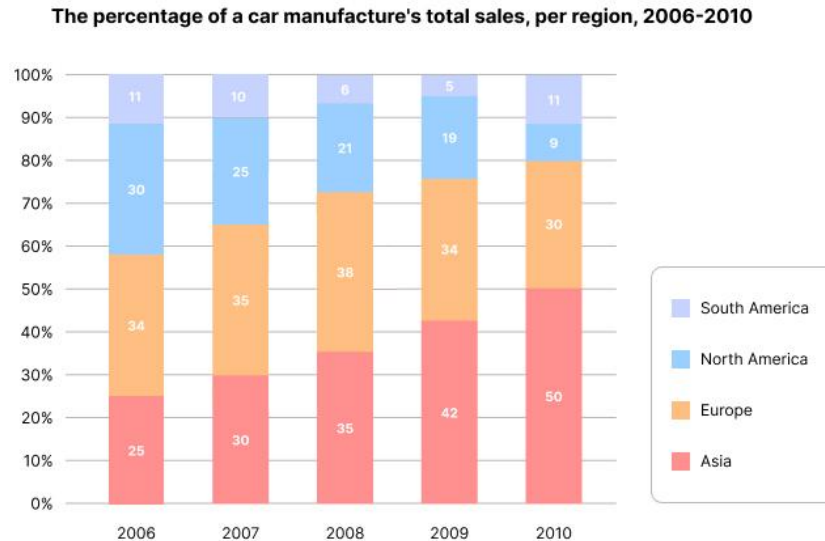

The bar chart shows the average number of years spent in school by adult males and females in Singapore from 2000 to 2010, while the pie charts show the distribution of educational qualifications among Singaporeans during the same period. Overall, the time spent in education increased for both genders, with males consistently spending slightly more years in school than females. Additionally, the pie charts reveal a significant improvement in higher education attainment over the decade.

In 2000, males spent an average of 9 years in school, compared to 8 years for females. While the number for females remained steady at around 8 years until 2002, males experienced a slight increase to about 10 years. This upward trend continued for males, who reached nearly 12 years by 2010. In contrast, the educational duration for females showed no significant changes throughout the period, remaining around 8 years.

The pie charts demonstrate a notable shift in educational qualifications between 2000 and 2010. In 2000, nearly one-third of Singaporeans held a high school qualification, and about 26% had only completed primary or secondary education. However, the percentage of those with university or master's qualifications was relatively low, at under 10%. By 2010, education levels had improved markedly, with nearly two-thirds of Singaporeans achieving a university degree. Only a small proportion, 2.1%, had primary school education as their highest qualification.

Word Count: 225

The chart shows the percentage of car manufacturer's total sales in North America, South America, Europe and Asia.

The bar chart illustrates the percentage distribution of a car manufacturer's total sales across four regions (Asia, Europe, North America, and South America) between 2006 and 2010.

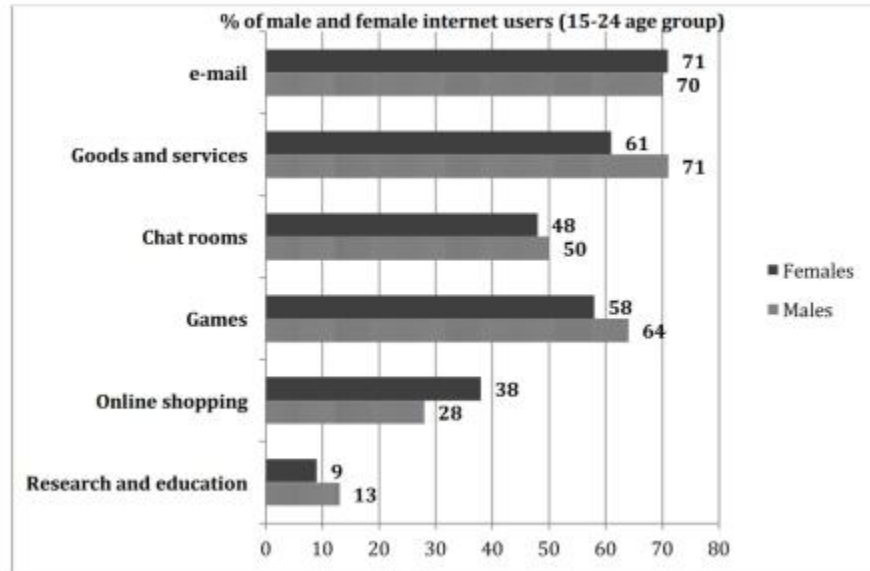

Overall, Asia became increasingly important to the company's sales over the period, eventually accounting for half of total sales in 2010. In contrast, North America experienced a substantial decline. Europe remained relatively stable before dropping slightly at the end of the period, while South America consistently represented the smallest share.

In 2006, Europe contributed the largest proportion of sales at 34%, followed closely by North America at 30%. Asia accounted for 25%, whereas South America made up the remaining 11%. Over the next two years, Asia's share rose steadily to 35% in 2008, equaling Europe's contribution that year. Meanwhile, North America's proportion decreased from 30% in 2006 to 21% in 2008, and South America fell from 11% to just 6%.

From 2009 onwards, Asia clearly dominated the company's sales, rising from 42% in 2009 to 50% in 2010. By contrast, North America continued to decline sharply to only 9% in 2010. Europe's share fell moderately to 30%, while South America recovered slightly to 11% in the final year.

Bar Chart

The graph below shows the way in which men and women used the Internet in Canada in 2000.

The bar chart compares the proportion of male and female internet users aged 15-24 who engaged in six different online activities.

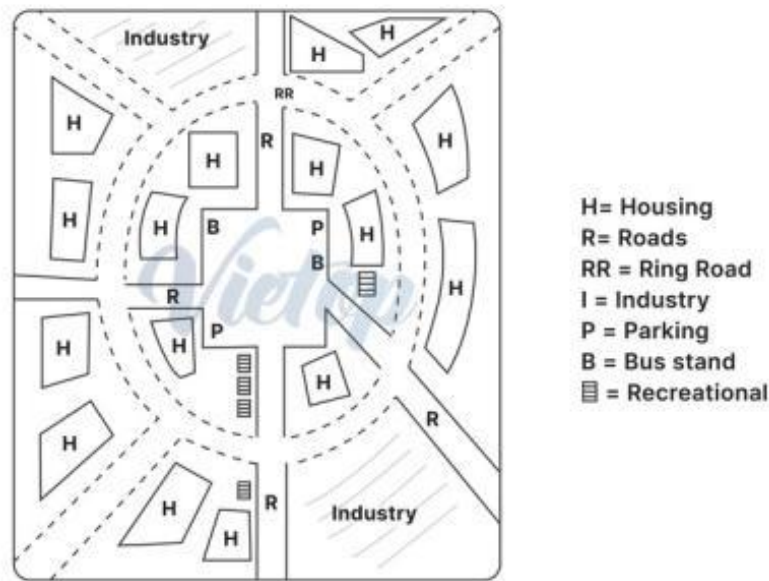

Overall, e-mail and accessing goods and services were the most common activities among both genders, while research and education were the least popular. Males generally dominated in games and research, whereas females were more involved in online shopping.

Looking first at similarities, e-mail usage was almost equal between males (70%) and females (71%), making it the most popular activity overall. A similar trend can be seen in goods and services, where 71% of men and 61% of women participated. Likewise, chat rooms attracted roughly half of both groups (50% of males and 48% of females).

In contrast, more notable gender differences appear in games, where 64% of males engaged compared to 58% of females. A bigger gap is evident in online shopping, favoured by 38% of women against only 28% of men. The sharpest difference, however, can be observed in research and education, where male users (13%) clearly outnumbered females (9%), though this activity remained the least popular for both.

In summary, while both genders showed a strong preference for e-mail and goods/services, men were more likely to use the internet for games and study, whereas women showed greater interest in online shopping.

Word Count: 214

The map below shows the plan of a proposed new town. Summarize the information by selecting and reporting the main features, and make comparisons where relevant.

The map illustrates the structure of a proposed new town. The new town includes: residential areas, parking and a bus stand.

Overall, the map is designed in a circular pattern. The residential areas are constructed inside and outside the ring road. Meanwhile, the bus stands and parkings are located at the center of the town surrounded by houses and recreational places.

Most of the housing regions are found inside and outside the ring road. They spread regularly around the map, linking with each other by roads. Two industrial zones are placed in the bottom-right and top-left corners, each area is surrounded by two roads, far from the accommodation regions.

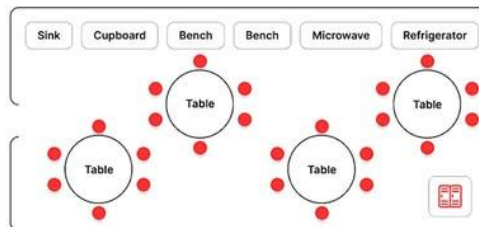

At the center of the town, there are two parkings and bus stands. Making this area a central place for transportation. There are also three recreational spaces located near the housing areas in different parts of the place, providing leisure facilities for residents.

Map

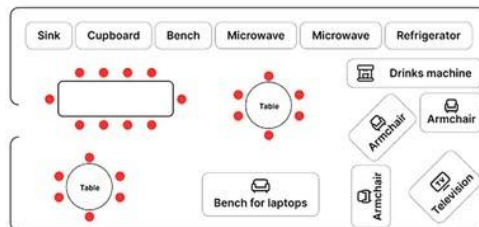

The plans show a student common room from five years ago and now.

Exam: 15 January 2026

Student common room- 5 years ago

Student common room- Now 

The diagrams compare the layout of a student common room five years ago with its current arrangement.

Overall, the room has been significantly modernized, with several new facilities added and the seating arrangement changed. While most of the kitchen appliances along the top wall remain, the center and right side of the room have been redesigned to provide more study and relaxation spaces.

Five years ago, the common room contained four round tables with chairs placed around them. Two of these tables were located in the upper area, while the other two were positioned in the lower part of the room. Along the top wall there were several kitchen facilities, including a sink, a cupboard, two benches, a microwave and a refrigerator. In addition, a small bookcase was situated in the bottom-right corner.

At present, the layout is more varied. One of the benches has been removed and an additional microwave has been installed. A large rectangular table with multiple seats has replaced one of the round tables in the upper-left area, while two round tables remain in the room. On the right side, new amenities such as a drinks machine, a television and several armchairs have been added. Furthermore, a bench specifically designed for laptop use is now located in the lower middle area.
